If you find information in this manual that is incorrect, misleading, or incomplete, we would appreciate your comments and suggestions.

FCC Warning

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the Instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

CE Mark Warning

This device is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Energy Saving Note of the Device

This power required device does not support Standby mode operation. For energy saving, please remove the power cable to disconnect the device from the power circuit. In view of saving the energy and reducing the unnecessary power consumption, it is strongly suggested to remove the power connection for the device if this device is not intended to be active.

WEEE Warning

To avoid the potential effects on the environment and human health as a result of the presence of hazardous substances in electrical and electronic equipment, end users of electrical and electronic equipment should understand the meaning of the crossed-out wheeled bin symbol. Do not dispose of WEEE as unsorted municipal waste and have to collect such WEEE separately.

Revision

User's Manual of PLANET Industrial L3 Managed Switch

FOR MODELS: IGS-6325-20T4C4X, IGS-6325-20S4C4X, IGS-6325-24P4X, IGS-6325-24P4S and IGS-6325-24UP4X

REVISION: 1.4 (Feb., 2025)

Part No: EM-IGS-6325 Series_v1.4

1. INTRODUCTION

Thank you for purchasing PLANET IGS-6325 Industrial Managed Switch series, which comes with multiple Gigabit Ethernet copper ports and SFP/SFP+ fiber optic connectibility, and robust Layer 3 features in a 19" rack-mountable chassis. "Industrial Managed Switch" is used as an alternative name in this user's manual.

1.1 Packet Contents

Open the box of the Industrial Managed Switch and carefully unpack it. The box should contain the following items:

Model Name Item	IGS-6325- 20T4C4X	IGS-6325- 20S4C4X	IGS-6325- 24P4X	IGS-6325- 24P4S	IGS-6325- 24UP4X
The Industrial Managed Switch					
Quick Installation Guide Sheet					
RS232 to RJ45 Console Cable					
Rack-mount Accessory Kit					
AC Power Cord					
RJ45 Dust Caps	25	5	25	25	25
SFP/SFP+ Dust Cap	8	28	8	4	4

If any of these are missing or damaged, please contact your dealer immediately.

1.2 Product Description

PLANET IGS-6325 series is an Industrial Layer 3 Managed Switch that features 24 Gigabit TP/SFP ports and 4 10G SFP+ ports, and supports Layer 3 IP routing in a 1U case. With 10Gbps uplink, the IGS-6325 series can handle extremely large amounts of data in a secure topology linking to an industrial backbone or high capacity servers.

Model Name	IGS-6325- 20T4C4X	IGS-6325- 20S4C4X	IGS-6325- 24P4X	IGS-6325- 24P4S	IGS-6325- 24UP4X

Power Input – AC	100-240V AC x 1	100-240V AC x 1			
Power Inpuit – DC	24-60V DC x 2	36-60V DC x 2	48-56V DC x 2	48-56V DC x 2	48-54V DC x 2

10Gbps Fiber Ports and Multiple Dual Speed Fiber Ports Deliver High-speed Networking

PLANET IGS-6325 Industrial Layer 3 Managed Rack-mount Series features 24 10/100/1000T or 24 100/1000X Gigabit ports, 4 10G SFP+ ports and Layer 3 IP routing in a 1U case. With 10Gbps uplink, the IGS-6325 Rack-mount series can handle extremely large amounts of data in a secure topology linking to an industrial backbone or high capacity servers. The IGS-6325 Rack-mount series is capable of providing non-blocking switch fabric and wire-speed throughput as high as 128Gbps in the temperature range from -40 to 75 degrees C. It greatly simplifies the tasks of upgrading the industrial LAN for catering to increasing bandwidth demands. Furthermore, it adopts user-friendly "Front Access" design for easy wiring and maintenance of the IGS-6325 Rack-mount series when placed in the cabinet.

Layer 3 Routing Support

IGS-6325 Rack-mount series enables the administrator to conveniently boost network efficiency by configuring Layer 3 IPv4/IPv6 VLAN static routing manually, and the IPv4 **OSPFv2** (Open Shortest Path First) settings automatically. The OSPF is an interior dynamic routing protocol for autonomous system based on link state. The protocol creates a database for link state by exchanging link states among Layer 3 switches, and then uses the Shortest Path First algorithm to generate a route table based on that database. (Note that IGS-6325-24UP4X supports more advanced dynamic routing verions such as OSPFv3 and RIPv2.)

Cybersecurity Network Solution to Minimize Security Risks

The cybersecurity feature included to protect the switch management in a mission-critical network virtually needs no effort and cost to install. For efficient management, the IGS-6325 Rack-mount series is equipped with console, web and SNMP management interfaces. With the built-in web-based management interface, the IGS-6325 Rack-mount series offers an easy-to-use, platform independent management and configuration facility. The IGS-6325 Rack-mount series supports SNMP and it can be managed via any management software based on the standard SNMP protocol. For reducing product learning time, the IGS-6325 Rack-mount series offers Cisco-like command via Telnet or console port and customer doesn't need to learn new command from these switches. Moreover, the IGS-6325 Rack-mount series offers remote secure management by supporting SSHv2, TLSv1.2 and SNMP v3 connection which can encrypt the packet content at each session.

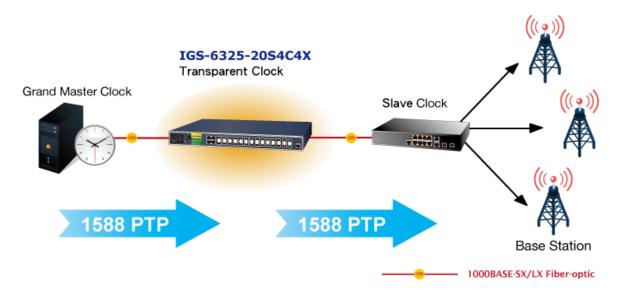

Modbus TCP Provides Flexible Network Connectivity for Factory Automation

With the supported Modbus TCP/IP protocol, the IGS-6325 Rack-mount series can easily integrate with SCADA systems, HMI systems and other data acquisition systems in factory floors. It enables administrators to remotely monitor the industrial Ethernet switch's operating information, port information and communication status, thus easily achieving enhanced monitoring and maintenance of the entire factory.

1588 Time Protocol for Industrial Computing Networks

The IGS-6325 Rack-mount series is ideal for telecom and carrier Ethernet applications, supporting MEF service delivery and timing over packet solutions for IEEE 1588 and synchronous Ethernet.

Time Synchronization in Network

AC and DC Redundant Power to Ensure Continuous Operation

The IGS-6325 Rack-mount series possesses a **100~240V AC** power supply and dual **24~60V DC** power supply utilized as redundant power supply to ensure its continuous operation. Its redundant power system is specifically designed to handle the demands of high-tech facilities requiring the highest power integrity. Furthermore, with the 24~60V DC power supply implemented, the IGS-6325 Rack-mount series can be applied as the **telecom level** device and placed in almost any difficult environment. (Note that IGS-6325-24UP4X accepts dual power inputs to achieve its maximum PoE budget rather than supporting redundant power supplies.)

Digital Input and Digital Output for External Alarm

The IGS-6325 Rack-mount series helps the network administrators efficiently manage the unexpected network situations by providing Digital Input and Digital Output for external alarm device on the front panel. The Digital Input can be used to detect and log the status of the external devices such as door intrusion detector. The Digital Output could be used to send alarm whenever the IGS-6325 Rack-mount series has port link-down or power failure.

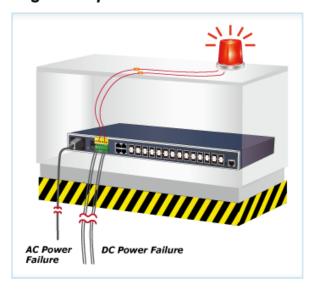

Digital Input

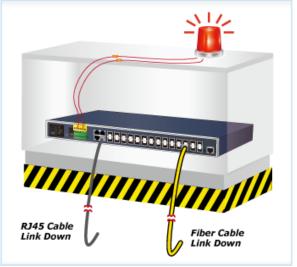

Digital Output

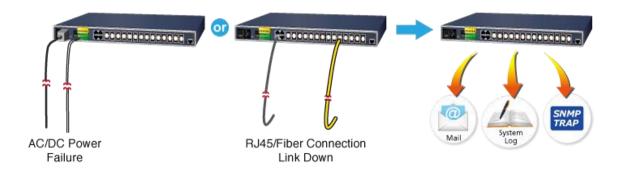

Effective Alarm Alert for Better Protection

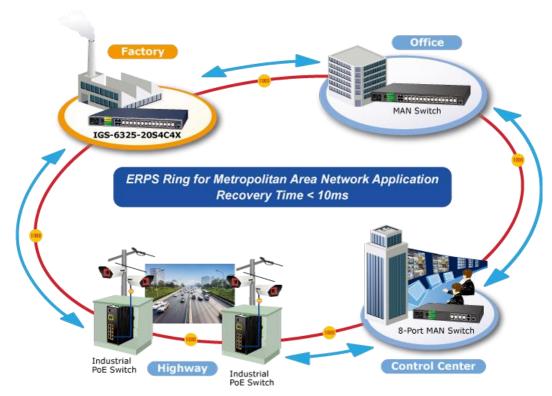

The IGS-6325 Rack-mount series supports a Fault Alarm feature which can alert the users when there is something wrong with the switches. With this ideal feature, the users would not have to waste time to find where the problem is. It will help to save time and human resource.

Fault Alarm Alert

Redundant Ring, Fast Recovery for Critical Network Applications

The IGS-6325 Rack-mount series supports redundant ring technology and features strong, rapid self-recovery capability to prevent interruptions and external intrusions. It incorporates advanced ITU-T G.8032 ERPS (Ethernet Ring Protection Switching) technology, Spanning Tree Protocol (802.1s MSTP), and redundant power input system into customer's industrial automation network to enhance system reliability and uptime in harsh factory environments. In a simple Ring network, the recovery time of data link can be as fast as 10ms.

IPv6/IPv4 Dual Stack

Supporting both IPv6 and IPv4 protocols, the IGS-6325 Rack-mount series helps data centers, campuses, telecoms, and more to experience the IPv6 era with the lowest investment as its network facilities need not be replaced or overhauled if the IPv6 FTTx edge network is set up.

Robust Layer 2 Features

The IGS-6325 Rack-mount series can be programmed for advanced switch management functions such as dynamic port link aggregation, **Q-in-Q VLAN**, private VLAN, **Multiple Spanning Tree Protocol (MSTP)**, Layer 2 to Layer 4 QoS, bandwidth control and **IGMP/MLD Snooping**. Via the link aggregation of supporting ports, the IGS-6325 Rack-mount series allows the operation of a high-speed trunk to combine with multiple fiber ports and supports fail-over as well.

Powerful Security

The IGS-6325 Rack-mount series offers a comprehensive Layer 2 to Layer 4 Access Control List (ACL) for enforcing security to the edge. It can be used to restrict network access by denying packets based on source and destination IP address, TCP/UDP ports or defined typical network applications. Its protection mechanism also comprises 802.1X Port-based and MAC-based user, and device authentication. With the private VLAN function, communication between edge ports can be prevented to ensure user privacy. The IGS-6325 Rack-mount series also provides DHCP Snooping, IP Source Guard and Dynamic ARP Inspection functions to prevent IP snooping from attack and discard ARP packets with invalid MAC address. The network administrators can now construct highly-secure corporate networks with considerably less time and effort than before.

Excellent Traffic Control

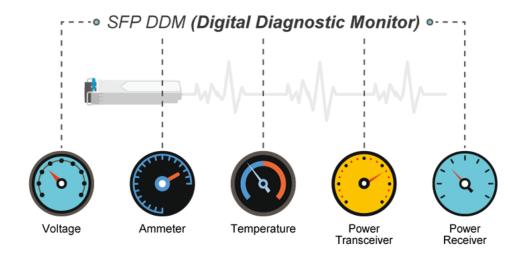

The IGS-6325 Rack-mount series is loaded with powerful traffic management and QoS features to enhance connection services by telecoms and ISPs. The QoS features include wire-speed Layer 4 traffic classifiers and bandwidth limit that are particularly useful for multi-tenant units, multi-business units, Telco and network service providers' applications. It also empowers the industrial environment to take full advantage of the limited network resources and guarantees the best performance in VoIP and video conferencing transmission.

Flexible and Extendable 10Gb Ethernet Solution

10G Ethernet is a big leap in the evolution of Ethernet. Each of the 10G SFP+ slots in the IGS-6325 Rack-mount series supports **triple speed** and **10GBASE-SR/LR**, **2500BASE-X or 1000BASE-SX/LX**. With its 4-port, 10G Ethernet link capability and additional 4-port 1G Ethernet link capability, the administrator now can flexibly choose the suitable SFP/SFP+ transceiver according to the transmission distance or the transmission speed required to extend the network efficiently. The IGS-6325 Rack-mount series provides broad bandwidth and powerful processing capacity.

The IGS-6325 Rack-mount series supports SFP-DDM (Digital Diagnostic Monitor) function that greatly helps network administrator to easily monitor real-time parameters of the SFP, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage.

High Power PoE for Security and Public Service Applications

As the whole system comes with a total **440-watt** PoE budget, the **IGS-6325-24P4X** and **IGS-6325-24P4S** are designed specifically to satisfy the growing demand of higher power consuming network PDs (powered devices) such as multi-channel (802.11a/b/g/n) wireless LAN access points, PTZ (pan, tilt, zoom) speed dome network cameras and other PoE network devices. (The IGS-6325-24UP4X has a total PoE budget of 1,440 watts when both power inputs are connected.)

Convenient and Smart ONVIF Devices with Detection Feature

PLANET has newly developed an awesome feature -- ONVIF Support -- which is specifically designed for co-operating with video IP surveillances. From the IGS-6325-24P4X, IGS-6325-24P4S and IGS-6325-24UP4X GUI, clients just need one click to search and show all of the ONVIF devices via network application. In addition, clients can upload floor images to the switch series, making the deployments of surveillance and other devices easy for planning and inspection purposes. Moreover, clients can get real-time surveillance's information and online/offline status; the PoE reboot can be controlled from the GUI.

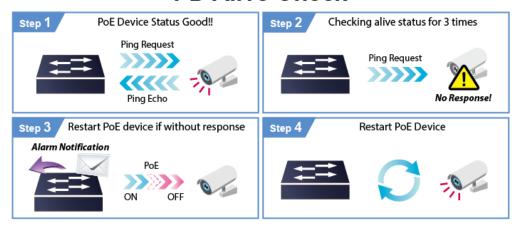

Intelligent Alive Check for Powered Device

The IGS-6325 PoE models can be configured to monitor connected PD's status in real time via ping action. Once the PD stops working and responding, the IGS-6325 PoE models will recycle the PoE port power and bring the PD back to work. It also greatly enhances the reliability in that the PoE port will reset the PD power, thus reducing administrator's management burden.

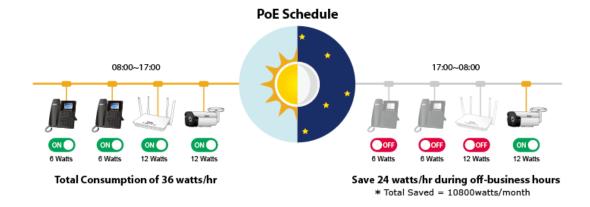

PD Alive Check

PoE Schedule for Energy Saving

Under the trend of energy saving worldwide and contributing to environmental protection on the Earth, the IGS-6325 PoE models can effectively control the power supply besides its capability of giving high watts power. The built-in "PoE schedule" function helps you to enable or disable PoE power feeding for each PoE port during specified time intervals and it is a powerful function to help SMBs or enterprises save power and money.

Scheduled Power Recycling

The IGS-6325 PoE models allows each of the connected PoE IP cameras or PoE wireless access points to reboot at a specific time each week. Therefore, it will reduce the chance of IP camera or AP crash resulting from buffer overflow.

1.3 How to Use This Manual

This User's Manual is structured as follows:

Section 2, INSTALLATION

The section explains the functions of the **Industrial Managed Switch** and how to physically install the **Industrial Managed Switch**.

Section 3, SWITCH MANAGEMENT

The section contains the information about the software function of the Industrial Managed Switch.

Section 4, WEB CONFIGURATION

The section explains how to manage the Industrial Managed Switch by Web interface.

Section 5, SWITCH OPERATION

The chapter explains how to do the switch operation of the Industrial Managed Switch.

Section 6, TROUBLESHOOTING

The chapter explains how to do troubleshooting of the Industrial Managed Switch.

Appendix A

The section contains cable information of the Industrial Managed Switch.

Appendix B

The section contains glossary information of the Industrial Managed Switch.

1.4 Product Features

Hardware Conformance

IGS-6325-20T4C4X and IGS-6325-20S4C4X

- One 100 to 240V AC or dual 24 to 60V DC power input, redundant power with reverse polarity protection
 - Active-active redundant power failure protection
 - Backup of catastrophic power failure on one supply
 - Fault tolerance and resilience

IGS-6325-24UP4X, IGS-6325-24P4X and IGS-6325-24P4S

- Dual 48 to 54V DC power input, redundant power with reverse polarity protection
 - Active-active redundant power failure protection
 - Backup of catastrophic power failure on one supply
 - Fault tolerance and resilience
- 19-inch rack-mountable design
- IP30 metal case protection
- Supports EFT protection for 6000V DC power and 6000V DC Ethernet ESD protection
- -40 to 75 degrees C operating temperature

> Industrial Protocol

Modbus TCP for real-time monitoring in the SCADA system

Digital Input and Digital Output

- 2 Digital Input (DI)
- 2 Digital Output (DO)
- Integrates sensors into auto alarm system
- Transfers alarm to IP network via email and SNMP trap

Layer 3 IP Routing Features

- Supports maximum 128 static routes and route summarization
- IP dynamic routing protocol supports OSPFv2
- Routing interface provides per VLAN routing mode

Layer 2 Features

- High performance of Store-and-Forward architecture, and runt/CRC filtering eliminates erroneous packets to optimize the network bandwidth
- Storm control support
 - Broadcast/Multicast/Unknown unicast

Supports VLAN

- IEEE 802.1Q tagged VLAN
- Provides Bridging (VLAN Q-in-Q) support (IEEE 802.1ad)
- Private VLAN Edge (PVE)
- Protocol-based VLAN
- MAC-based VLAN
- IP subnet-based VLAN
- Voice VLAN
- GVRP (GARP VLAN Registration Protocol)
- Up to 4K VLANs groups, out of 4096 VLAN IDs

■ Supports Spanning Tree Protocol

- IEEE 802.1D Spanning Tree Protocol (STP)
- IEEE 802.1w Rapid Spanning Tree Protocol (RSTP)
- IEEE 802.1s Multiple Spanning Tree Protocol (MSTP), spanning tree by VLAN
- BPDU Guard

Supports Link Aggregation

- 802.3ad Link Aggregation Control Protocol (LACP)
- Cisco ether-channel (static trunk)
- Maximum 14 trunk groups, with 16 ports for each trunk
- Up to 32Gbps bandwidth (full duplex mode)
- Provides port mirror (many-to-1)
- Port mirroring monitors the incoming or outgoing traffic on a particular port
- Loop protection to avoid broadcast loops
- Supports ERPS (Ethernet Ring Protection Switching)
- Compatible with Cisco Uni-directional link detection (UDLD) that monitors a link between two switches and blocks the ports on both ends of the link if the link fails at any point between the two devices
- IEEE 1588 and Synchronous Ethernet network timing
- Link Layer Discovery Protocol (LLDP)

Quality of Service

- Ingress shaper and egress rate limit per port bandwidth control
- 8 priority queues on all switch ports
- Traffic classification
 - IEEE 802.1p CoS
 - ToS/DSCP/IP Precedence of IPv4/IPv6 packets
 - IP TCP/UDP port number
 - Typical network application
- Strict priority and Weighted Round Robin (WRR) CoS policies
- Traffic policing on the switch port
- DSCP remarking
- Voice VLAN

Multicast

- Supports IPv4 IGMP snooping v1, v2 and v3
- Supports IPv6 MLD snooping v1 and v2
- Querier mode support
- IGMP snooping port filtering
- MLD snooping port filtering
- MVR (Multicast VLAN Registration)

Security

- Authentication
 - IEEE 802.1x port-based/MAC-based network access authentication
 - IEEE 802.1x authentication with guest VLAN
 - Built-in RADIUS client to cooperate with the RADIUS servers
 - RADIUS/TACACS+ users access authentication
- Access Control List
 - IP-based Access Control List (ACL)
 - MAC-based Access Control List (ACL)
- Source MAC/IP address binding
- **DHCP Snooping** to filter distrusted DHCP messages
- Dynamic ARP Inspection discards ARP packets with invalid MAC address to IP address binding
- IP Source Guard prevents IP spoofing attacks
- IP address access management to prevent unauthorized intruder

Management

- IPv4 and IPv6 dual stack management
- Switch Management Interfaces
 - Console/Telnet command line interface
 - Web switch management
 - SNMP v1, v2c, and v3 switch management
 - SSH/SSL secure access
- IPv6 address/NTP management
- Built-in Trivial File Transfer Protocol (TFTP) client
- BOOTP and DHCP for IP address assignment
- System Maintenance
 - Firmware upload/download via HTTP/TFTP
 - Reset button for system reboot or reset to factory default
 - Dual images
- DHCP relay and option 82
- DHCP Server
- User privilege levels control
- NTP (Network Time Protocol)

- Link Layer Discovery Protocol (LLDP) and LLDP-MED
- Network diagnostic
 - SFP-DDM (Digital Diagnostic Monitor)
 - Cable diagnostic technology provides the mechanism to detect and report potential cabling issues
 - ICMPv6/ICMPv4 remote ping
- SMTP/Syslog remote alarm
- Four RMON groups (history, statistics, alarms and events)
- SNMP trap for interface link up and link down notification
- System Log
- PLANET Smart Discovery Utility for deployment management

Power over Ethernet

IGS-6325-24P4X and IGS-6325-24P4S

- Complies with IEEE 802.3at Power over Ethernet Plus end-span PSE
- Backward compible with IEEE 802.3af Power over Ethernet end-span PSE
- Up to 24 ports of IEEE 802.3af/802.3at devices powered
- Supports PoE power up to 36 watts for each PoE port
- Auto detects powered device (PD)
- Circuit protection prevents power interference between ports
- Remote power feeding up to 100 meters
- PoE Management
 - Total PoE power budget control
 - Per port PoE function enable/disable
 - PoE Port Power feeding priority
 - Per PoE port power limitation
 - PD classification detection
 - PD alive check
 - PoE schedule
 - PD scheduled power recycling

IGS-6325-24UP4X

- Compliance with IEEE 802.3bt Type-4 PoE++ standard
- Backward compatibility with IEEE 802.3af/at PD device
- Power up to 24 IEEE 802.3bt PoE++ devices (60W) using dual power input
- Each port has a maximum power output of 95 watts (Using the maximum amount may reduce the number of available ports.)
- Total of 1440-watt PoE budget
 - A single power input can provide a power budget of up to 720W.
 - Two power inputs can provide a power budget of up to 1,440W.

- Detects Powered Devices (PD) automatically.
- Circuit protection prevents power interference between ports.
- Power feeding up to 100m
- PoE management features
 - Total PoE power budget control
 - Per port PoE function enable/disable
 - PoE admin-mode control
 - PoE port power feeding priority
 - Per PoE port power limit
 - PD classification detection
 - PoE extension mode to support power feeding up to a maximum distance of 160 meters.
- Intelligent PoE features
 - Temperature threshold setting
 - PoE usage threshold setting
 - PD alive check
 - PoE schedule

1.5 Product Specifications

■ IGS-6325 Non-PoE Models

Product	IGS-6325-20T4C4X	IGS-6325-20S4C4X
Hardware Specifications		
Copper Ports	24 10/100/1000BASE-T RJ45 auto- MDI/MDI-X ports	4 10/100/1000BASE-T RJ45 auto-MDI/MDI- X ports, shared with Port-1 to Port-4
SFP/mini-GBIC Slots	4 100/1000BASE-X SFP interfaces, shared with Port-21 to Port-24 Compatible with 100BASE-FX SFP transceiver	14 100/1000BASE-X SFP interfaces (Port-1 to Port-14) Compatible with 100BASE-FX SFP transceiver 10 100/1000/2500BASE-X SFP interfaces (Port-15 to Port-24) Compatible with 100BASE-FX and 2500BASE-X SFP transceiver
SFP+ Slots	4 10GbBASE-SR/LR SFP+ interfaces (Port-Compatible with 1000BASE-SX/LX/BX and 2	
Console	1 x RS232-to-RJ45 serial port (115200, 8, N	, 1)
Reset Button	< 5 sec: System reboot > 5 sec: Factory default	
Dimensions (W x D x H)	440 x 200 x 44.5 mm, 1U height	
Weight	2980g	2935g
Power Consumption	AC input Max. 36 watts/122.8 BTU DC input: Max. 38 watts/130 BTU	AC input: Max. 38.3 watts/131.4 BTU DC input: Max. 41.4 watts/142 BTU
Power Requirements – AC	AC 100~240V, 50/60Hz 1A	
Power Requirements – DC	DC 24~60V, 1.7A	DC 24~60V, 2.25A
DI and DO	2 digital input (DI): Level 0: -24~2.1V Level 1: 2.1~24V Max. input current: 10mA 2 digital output (DO): Open collector to 24VE	DC, 100mA
EFT Protection	6KV DC	
ESD Protection	6KV DC	
LED Indicators	System: AC (Green), DC1 (Green), DC2 (Green), Fault (Red) Ring (Green), DI/DO. Switching Specifications	TOGDPS ENRACT (Amber)	
Switch Architecture	Store-and-Forward	
Switch Fabric	128Gbps/non-blocking	
Throughput	95.2Mpps@64Bytes	
Address Table	32K entries, automatic source address learning and aging	
Shared Data Buffer	32M bits	
	IEEE 802.3x pause frame for full duplex	
Flow Control	Back pressure for half duplex	
Jumbo Frame	10K bytes	
Layer 2 Management Function	ns	
	Port disable/enable	
Port Configuration	Auto-negotiation 10/100/1000Mbps full and half duplex mode selection	
	Flow control disable/enable	
Port Status	Display each port's speed duplex mode, link status, flow control status, auto-negotiation	
T OIT Otatus	status, trunk status	
	TX/RX/Both	
Port Mirroring	Many-to-1 monitor	
	Rmirror – Remote Switch Port Analyzer (Cisco RSPAN)	
	IEEE 802.1Q tag-based VLAN	
	IEEE 802.1ad Q-in-Q tunneling	
	Private VLAN Edge (PVE)	
	MAC-based VLAN	
VLAN	Protocol-based VLAN	
	Voice VLAN IP Subnet-based VLAN	
	MVR (Multicast VLAN registration)	
	Up to 4K VLAN groups, out of 4096 VLAN IDs	
	GVRP	
Link Aggregation	IEEE 802.3ad LACP/static trunk	
Link Aggregation	14 trunk groups with 16 port per trunk group	
	IEEE 802.1D Spanning Tree Protocol	
Spanning Tree Protocol	IEEE 802.1w Rapid Spanning Tree Protocol	
	IEEE 802.1s Multiple Spanning Tree Protocol	
IGMP Snooping	IGMP (v1/v2/v3) snooping	
	IGMP querier mode support	
	Supports 255 IGMP groups	
MLD Snooping	MLD (v1/v2) snooping	
	MLD querier mode support Supports 255 MLD groups	
Bandwidth Control	Per port bandwidth control Ingress: 100Kbps~1000Mbps	
	Egress: 100Kbps~1000Mbps	

	Supports ERPS, and complies with ITU-T G.8032
Ring	Recovery time < 10ms @ 3 units
	Recovery time < 50ms @16 units
	IEEE 1588v2 PTP (Precision Time Protocol)
Synchronization	- Peer-to-peer transparent clock
	- End-to-end transparent clock
	Traffic classification based, strict priority and WRR
	8-level priority for switching:
	- Port number
QoS	- 802.1p priority
	- 802.1Q VLAN tag
	- DSCP/ToS field in IP packet
Security Functions	
	IP-based ACL/MAC-based ACL
	ACL based on:
	- MAC Address
	- IP Address
	- Ethertype
Access Control List	- Protocol Type
	- VLAN ID
	- DSCP
	- 802.1p Priority
	Up to 256 entries
	Port Security
	IP source guard
Security	Dynamic ARP inspection
	Command line authority control based on user level
	RADIUS client
AAA	TACACS+ client
Network Access Control	IEEE 802.1x port-based network access control MAC-based authentication
Network Access Control	Local/RADIUS authentication
Layer 3 Functions	2004/11/10/00 dathoritication
	Mary 400 VII AN interference
IP Interfaces	Max. 128 VLAN interfaces
Routing Table	Max. 128 routing entries
	IPv4 hardware static routing
Routing Protocols	IPv6 hardware static routing
	OSPFv2 dynamic routing
Management	
Basic Management Interfaces	Console; Telnet; Web browser; SNMP v1, v2c
Secure Management	
Interfaces	SSHv2, TLSv1.2, SNMPv3
System Management	Firmware upgrade by HTTP protocol through Ethernet network
	Configuration upload/download through HTTP
	Remote syslog
	System log
	LLDP protocol
	NTP

■ IGS-6325 PoE Models

Product	IGS-6325-24UP4X	IGS-6325-24P4X	IGS-6325-24P4S
Hardware Specifications			
Copper Ports	24 10/100/1000BASE-T RJ45 a	uto-MDI/MDI-X ports	
SFP/mini-GBIC Slots	N/A	24	aces, shared with Port-21 to Port-
SFP+ Slots	Backward compatible with 100BASE-FX SFP transceiver 4 10GbBASE-SR/LR SFP+ interfaces (Port-25 to Port-28) Backward compatible with 1000BASE-SX/LX/BX SFP N/A transceiver		
Console	1 x RS232-to-RJ45 serial port (115200, 8, N, 1)	
Switch Architecture	Store-and-Forward		
Switch Fabric	128Gbps/non-blocking		48Gbps/non-blocking
Throughput	95.2Mpps@64Bytes		35.7Mpps@64Bytes
Address Table	16K entries, automatic source a	address learning and aging	
Shared Data Buffer	32M bits	0 00	
Flow Control	IEEE 802.3x pause frame for fu Back pressure for half duplex	II duplex	
Jumbo Frame	10K bytes		
Reset Button	< 5 sec: System reboot > 5 sec: Factory default		
ESD Protection	5KV DC		
Enclosure	IP30 metal case		
Connector	Fixed 6-pin terminal block for power input Pin 1/2 for Power 1, Pin 3/4 for fault alarm, Pin 5/6 for Power 2 Removable 6-pin terminal block for DI/DO interface Pin 1/2 for DI 1 & 2, Pin 3/4 for DO 1 & 2, Pin 5/6 for GND		
Alarm	One relay output for power failure. Alarm relay current carry ability: 3A @ 24V DC	One relay output for power failuability: 1A @ 24V DC	ıre. Alarm relay current carry
DI and DO	2 Digital Input (DI): Level 0: -24~2.1V (±0.1V) Level 1: 2.1V~24V (±0.1V) Max. input current: 10mA 2 Digital Output (DO): Open collector to 24VDC, 100mA		
LED Indicators	System: DC1 (Green), DC2 (Green), F Ring (Green), R.O. (Green), I 10/100/1000T RJ45 PoE+ Interfaces (Port 1 to Port 24): bt PoE++ (Green) af/at PoE (Amber) 1000 LNK/ACT (Green) 100 LNK/ACT (Amber) 100/1000Mbps SFP Combo Interfaces (Green) 1000Mbps LNK/ACT (Green)	10/100/1000T RJ45 PoE+ Inter PoE-in-Use (Amber) LNK/ACT (Green) erfaces (Port 21 to Port 24):	faces (Port 1 to Port 24):

	1G/2.5G/10Gbps Fiber Interface(Port 25 to Port 28) 1G/2.5Gbps LNK/ACT (Green) 10Gbps LNK/ACT (Amber)	1/10Gbps SFP+ Interfaces (Port 25 to Port 28) 10Gbps LNK/ACT (Green) 1Gbps LNK/ACT (Amber)	N/A
Dimensions (W x D x H)	440 x 300 x 44 mm, 1U height		
Weight	4051g	3800g	3740g
Power Consumption	Max. 20.74 watts/70.8 BTU (Power on without any connection)	Max. 33 watts/112.51 BTU (Power on without any connection)	Max. 33 watts/112.51 BTU (Power on without any connection)
	Max. 1522 watts/5262.9 BTU (Full loading with PoE function)	Max. 540 watts/1841.13 BTU (Full loading with PoE function)	Max. 536 watts/1828.90 BTU (Full loading with PoE function)
Power Requirements	Dual 48~54V DC, 32A max.	Dual 48~56V DC (>53V DC for 11A	PoE+ output recommended),
Power Over Ethernet			
PoE Standard	IEEE 802.3bt PoE++ Type-4	IEEE 802.3at Power over Ether	net Plus/PSE
PoE Power Supply Type	End-span Mid-span BT: End-span + Mid-span	End-span	
PoE Power Output	Per port 48V ~ 54VDC - 802.3bt Type-4 mode: maximum 95 watts - End-span mode: maximum 36 watts - Mid-span mode: maximum 36 watts - Force mode: maximum 95 watts	IEEE 802.3af Standard - Per port 48V~51V DC (dependance) - Per port 45.4 watts IEEE 802.3at Standard - Per port 52V~56V DC (demax. 36 watts	ending on the power supply) epending on the power supply),
Power Pin Assignment	802.3bt/UPoE: 1/2(-), 3/6(+), 4/5(+), 7/8(-) 802.3at PoE: End-span: 1/2(-), 3/6(+) 802.3at PoE: Mid-span: 4/5(+), 7/8(-)	802.3at PoE: End-span: 1/2(+), 3/6(-)
PoE Power Budget	54V Power input - Single power input: 720W maximum (depending on power input) - Dual power input: 1440W maximum (depending on power input) **The DC voltage of the dual power input must match, such as dual 54V.	- Dual power input: 300W maximum (depending on power input) 52~56V Power input - Single power input: 240W maximum (depending on power	

		dual 56V
Number of 90W 802.3bt Type-4 PDs	16	0
Number of 60W 802.3bt Type-3 PDs	24	0
Number of 30W 802.3at Type-2 PDs	24	24
Layer 3 Functions		
IP Interfaces	Max. 128 VLAN interfaces	
Routing Table	Max. 128 static routing entries Max. 4K routing table entries	
Routing Protocols	IPv4 RIPv1/v2 dynamic routing IPv4 OSPFv2 dynamic routing IPv6 OSPFv3 dynamic routing IPv4 hardware static routing IPv6 hardware static routing	IPv4 OSPFv2 dynamic routing IPv4 hardware static routing IPv6 hardware static routing
Layer 2 Functions		
Port Configuration	Port disable/enable Auto-negotiation 10/100/1000Mbps full and half duplex mode selection Flow control disable/enable Power saving mode control	
Port Status	Display each port's speed duplex mode, link status, flow control status, auto negotiation status, trunk status	
Port Mirroring	TX / RX / Both Many-to-1 monitor RMirror – Remote Switched Port Analyzer (Cisco RSPAN)	
VLAN	Supports up to 5 sessions IEEE 802.1Q tag-based VLAN IEEE 802.1ad Q-in-Q tunneling Private VLAN Edge (PVE) MAC-based VLAN Protocol-based VLAN Voice VLAN MVR (Multicast VLAN Registration) GVRP (GARP VLAN Registration Protocol) Up to 256 VLAN groups, out of 4096 VLAN IDs	
Link Aggregation	IEEE 802.3ad LACP/static trunk Supports 14 trunk groups with 1	
Spanning Tree Protocol	IEEE 802.1D Spanning Tree Protocol IEEE 802.1w Rapid Spanning Tree Protocol IEEE 802.1s Multiple Spanning Tree Protocol Supports 7 MSTP instances BPDU Guard, BPDU filtering and BPDU transparent Root Guard	
QoS	Traffic classification based, strict priority and WRR 8-level priority for switching - Port number	

	- 802.1p priority - 802.1Q VLAN tag
	- DSCP/TOS field in IP packet
	IPv4 IGMP (v1/v2/v3) snooping, up to 255 multicast groups
IGMP Snooping	IPv4 IGMP querier mode support
MLD Snooping	IPv6 MLD (v1/v2) snooping, up to 255 multicast groups IPv6 MLD querier mode support
Access Control List	IP-based ACL/MAC-based ACL Up to 256 entries
Bandwidth Control	Per port bandwidth control Ingress: 10Kbps~13000Mbps Egress: 100Kbps~13000Mbps
Management	
Basic Management Interfaces	Console; Telnet; Web browser; SNMP v1, v2c
Secure Management Interfaces	SSHv2, TLSv1.2, SNMP v3
	RFC 1213 MIB-II
	RFC 1493 Bridge MIB
	RFC 1643 Ethernet MIB
	RFC 2863 Interface MIB
	RFC 2665 Ether-Like MIB
	RFC 2819 RMON MIB (Groups 1, 2, 3 and 9)
	RFC 2737 Entity MIB
	RFC 2618 RADIUS Client MIB
SNMP MIBs	RFC 2863 IF-MIB
	RFC 2933 IGMP-STD-MIB
	RFC 3411 SNMP-Frameworks-MIB
	RFC 4292 IP Forward MIB
	IEEE 802.1X PAE
	RFC 4293 IP MIB
	RFC 4836 MAU-MIB
	LLDP
	PowerEthernet MIB
Standards Conformance	
Regulatory Compliance	FCC Part 15 Class A, CE
	IEEE 802.3 10BASE-T
	IEEE 802.3u 100BASE-TX/100BASE-FX
	IEEE 802.3z Gigabit SX/LX
Standards Compliance	IEEE 802.3ab Gigabit 1000T
	IEEE 802.3ae 10Gigabit Ethernet
	IEEE 802.3x flow control and back pressure
	IEEE 802.3ad port trunk with LACP

2. INSTALLATION

2.1 Hardware Description

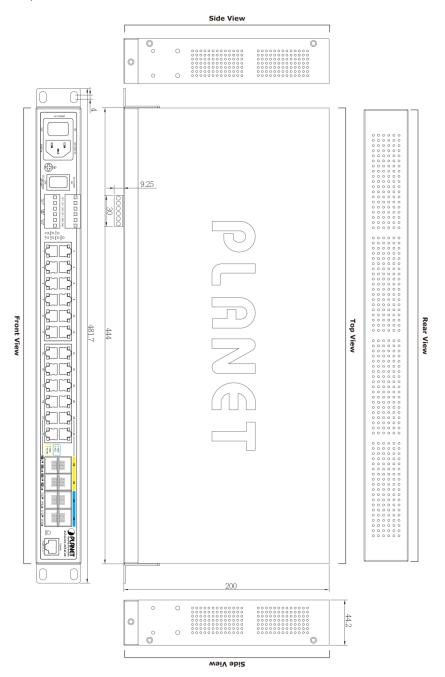

The Industrial Managed Switch provides three different running speeds – 10Mbps, 100Mbps or 10000Mbps and automatically distinguishes the speed of incoming connection.

This section describes the hardware features of Industrial Managed Switch. For easier management and control of the Industrial Managed Switch, familiarize yourself with its display indicators and ports. Front panel illustrations in this chapter display the unit LED indicators. Before connecting any network device to the Industrial Managed Switch, read this chapter carefully.

2.1.1 Physical Dimensions

■ IGS-6325-20T4C4X

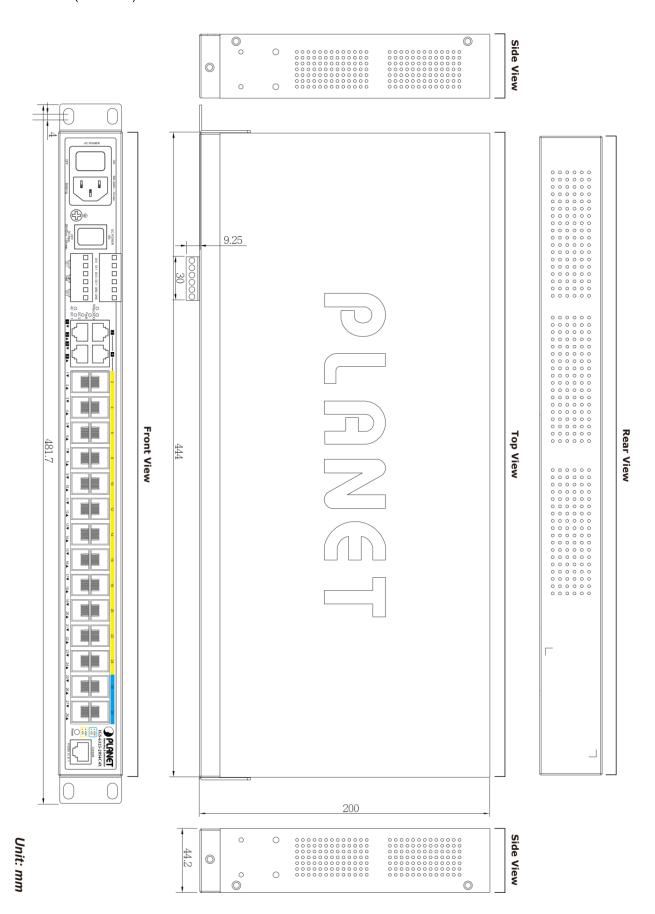

Dimensions (W x D x H): 440 x 200 x 44.5mm

■ IGS-6325-20S4C4X

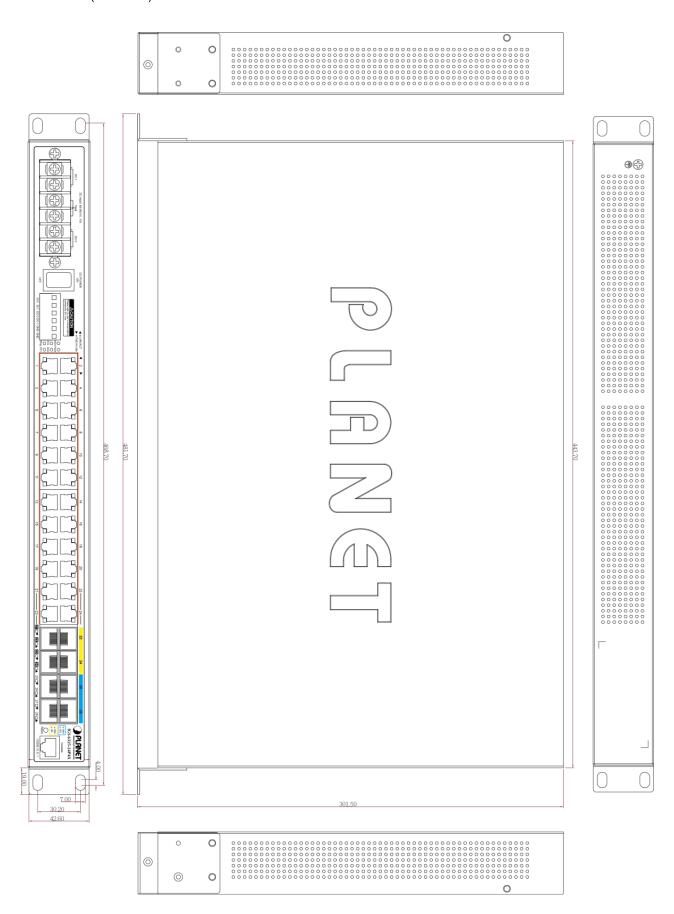

Dimensions (W x D x H): 440 x 200 x 44.5mm

■ IGS-6325-24P4X

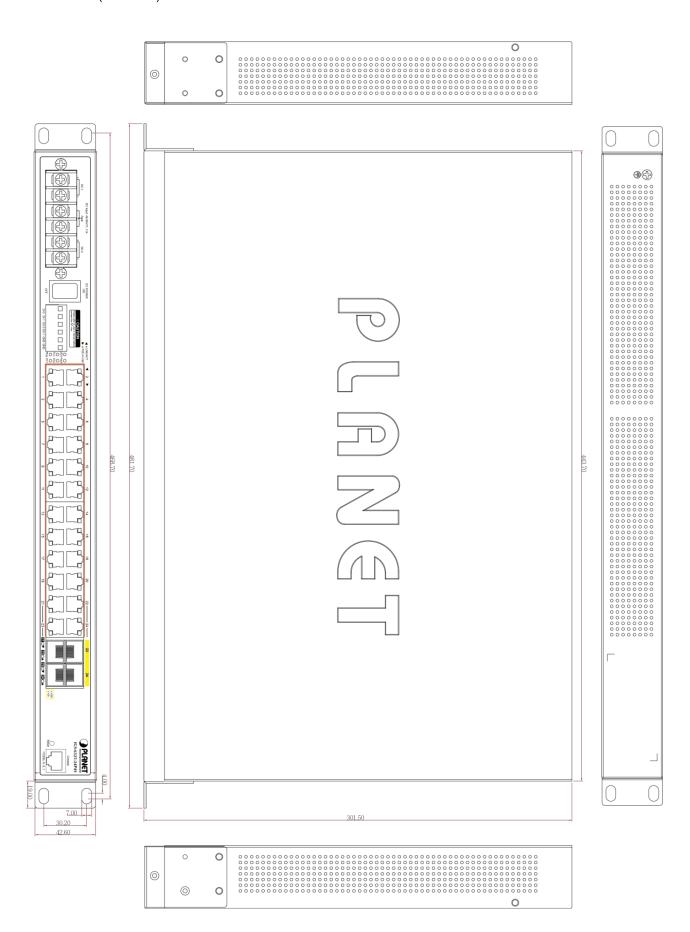

Dimensions (W x D x H) : 440 x 300 x 44.5mm

■ IGS-6325-24P4S

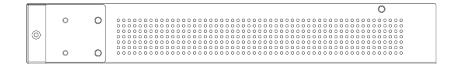

Dimensions (W x D x H) : 440 x 300 x 44.5mm

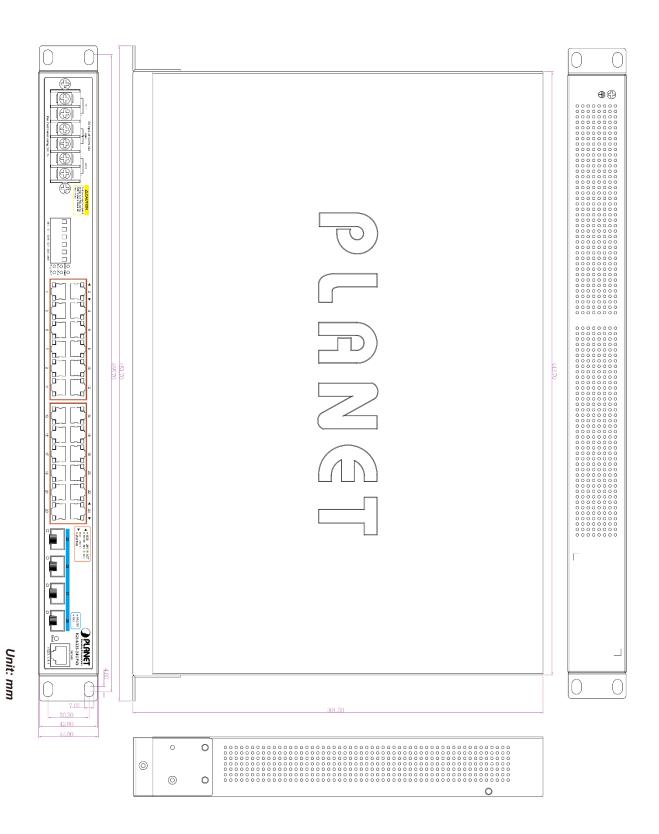

■ IGS-6325-24UP4X

Dimensions (W x D x H) : 440 x 300 x 44mm

2.1.2 Front Panel

The front panel provides a simple interface monitoring the Industrial Managed Switch. Figure 2-1-1 to Figure 2-1-5 show the front panels of the Industrial Managed Switches.

■ Gigabit TP Interface

10/100/1000BASE-T Copper, RJ45 twisted-pair: Up to 100 meters.

SFP Slot

100/1000BASE-X mini-GBIC slot, SFP (Small-form Factor Pluggable) transceiver module: From 550 meters to 2km (multi-mode fiber) and to 10/20/30/40/50/70/120 kilometers (single-mode fiber).

10 Gigabit SFP+ Slot

10GBASE-SR/LR mini-GBIC slot, SFP+ (Small Factor Pluggable Plus) transceiver module supports a distance from 300 meters (multi-mode fiber) to up to 10 kilometers (single mode fiber).

■ AC Power Receptacle for IGS-6325-20T4C4X and IGS-6325-20S4C4X

For compatibility with electrical service in most areas of the world, the Industrial Managed Switch's power supply automatically adjusts to line power in the range of 100-240V AC and 50/60 Hz.

Plug the female end of the power cord firmly into the receptacle on the front panel of the Industrial Managed Switch and the other end into an electrical outlet, and then the power will be ready.

The device is a power-required device, which means it will not work till it is powered. If your networks should be active all the time, please consider using UPS (Uninterrupted Power Supply) for your device. It will prevent you from network data loss or network downtime. In some areas, installing a surge suppression device may also help to protect your Managed Switch from being damaged by unregulated surge or current to the Switch or the power adapter.

DC Power Connector for IGS-6325-20T4C4X and IGS-6325-20S4C4X

The front panels of the IGS-6325-20T4C4X and IGS-6325-20S4C4X contain a power switch and a DC power connector, which accept DC power input voltage from **24V to 60V DC**. Connect the power cable to the Industrial Managed Switch at the input terminal block.

DC Power Connector for IGS-6325-24P4X and IGS-6325-24P4S

The front panels of the IGS-6325-24P4X and IGS-6325-24P4S contains a power switch and a DC power connector, which accept DC power input voltage from **48V to 56V DC**. Connect the power cable to the Industrial Managed Switch at the input terminal block. The size of the two screws in the terminal block is M3.5.

■ DC Power Connector for IGS-6325-24UP4X

The front panels of the IGS-6325-24UP4X has a DC power connector, which can accept single or dual DC power input voltage from **48V to 54V DC**. Connect the power cable to the Industrial Managed Switch at the input terminal block. The size of the two screws in the terminal block is M3.5.

Digital Input

The digital input of the Industrial Managed Switch can be activated by the external sensor that senses physical changes.

These changes can include intrusion detection or certain physical change in the monitored area. For example, the external sensor can be a door switch or an infrared motion detector.

Digital Output

The digital output main function is to allow the Industrial Managed Switch to trigger external devices, either automatically or by remote control from a human operator or a software application.

Console Port

The console port is an RJ45 port connector. It is an interface for connecting a terminal directly. Through the console port, it provides rich diagnostic information including IP address setting, factory reset, port management, link status and system setting. Users can use the attached DB9 to RJ45 console cable in the package and connect to the console port on the device. After the connection, users can run any terminal emulation program (Hyper Terminal, ProComm Plus, Telix, Winterm and so on) to enter the startup screen of the device.

Reset Button

On the upper left side of the front panel, the reset button is designed for rebooting the Industrial Managed Switch without turning off and on the power. The following is the summary table of reset button functions:

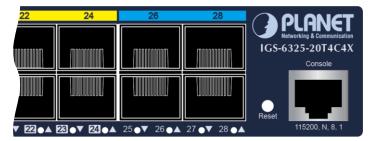

Figure 2-1-6: Reset Button of IGS-6325-20T4C4X

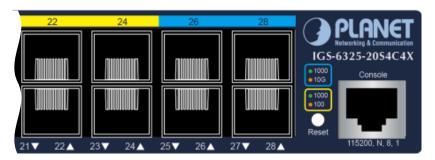

Figure 2-1-7: Reset Button of IGS-6325-20S4C4X

Figure 2-1-8: Reset Buttons of IGS-6325-24P4X and IGS-6325-24P4S

2.1.3 LED Indications

The front panel LEDs indicate instant statuses of power and ring, R.O., DI/DO and fault; they help monitor and troubleshoot when needed. Figures 2-1-10 to 2-1-17 show the LED indications of the Industrial Managed Switch.

IGS-6325-20T4C4X and IGS-6325-20S4C4X

Figure 2-1-10: IGS-6325-20T4C4X LEDs on Front Panel

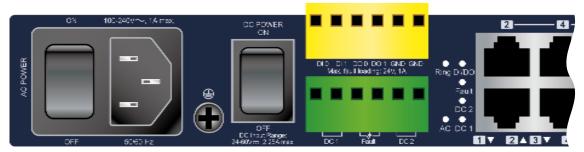

Figure 2-1-11: IGS-6325-20S4C4X LEDs on Front Panel

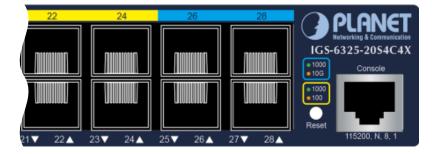

Figure 2-1-12: IGS-6325-20T4C4X and IGS-6325-20S4C4X LEDs on Front Panel

■ System

LED	Color	Function		
AC	Green	Lights to indicate AC power input has power.		
DC1	Green	Lights to indicate DC power input 1 has power.		
DC2	Green	Lights to indicate DC power input 2 has power.		
Fault	Red	Lights to indicate that Switch DC or port has failed.		
Ring	Green	Lights to indicate that the ERPS Ring has been created successfully.		
D.O.	0	Lights to indicate that Ring state is in idle mode.		
R.O.	R.O. Green	Blinks to indicate that the Ring state is in protected mode.		
DI/DO	Red	Blinks to indicate that Switch DC or port has failed or DI has event.		

■ Per 10/100/1000BASE-T Port

LED	Color	Function		
1000 LNK/ACT	Green	Lights to indicate the port is running at 1000Mbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.		
10/100 LNK/ACT	Amber	Light to indicate the port is running at 10/100Mbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.		

■ Per SFP Interface

LED	Color	Function
1000/2500 LNK/ACT	Green	Lights to indicate the port is running at 1000/2500Mbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.
100 LNK/ACT	Amber	Lights to indicate the port is running at 100Mbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.

Note: The link speed 2500Mbps of SFP interface in IGS-6325-20S4C4X only start from Port 5 to Port 24.

■ Per 1/10G SFP+ Interface

LED	Color	Function
1000/2500 LNK/ACT	Green	Lights to indicate the port is running at 1/2.5Gbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.
10G LNK / ACT	Amber	Lights to indicate the port is running at 10Gbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.

IGS-6325-24P4X and IGS-6325-24P4S

Figure 2-1-13: IGS-6325-24P4X and IGS-6325-24P4S LEDs on Front Panel

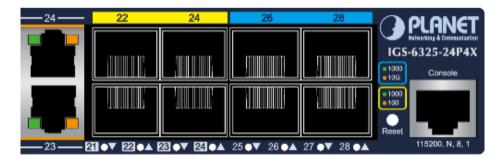

Figure 2-1-14: IGS-6325-24P4X LEDs on Front Panel

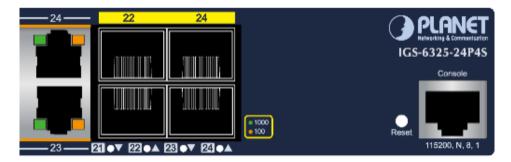

Figure 2-1-15: IGS-6325-24P4S LEDs on Front Panel

■ System

LED	Color	Function		
DC1	Green	Lights to indicate DC power input 1 has power.		
DC2	Green	Lights to indicate DC power input 2 has power.		
Fault	Red	Lights to indicate that Switch DC or port has failed.		
Ring	Green	Lights to indicate that the ERPS Ring has been created successfully.		
D.0	0	Lights to indicate that Ring state is in idle mode.		
R.O.	Green	Blinks to indicate that the Ring state is in protected mode.		
DI/DO	Red	Blinks to indicate that Switch DC or port has failed or DI has event.		

■ Per 10/100/1000BASE-T 802.3at PoE+ Port

LED	Color	Function		
LNK/ACT	Green	Lights to indicate the port is running at 1000Mbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.		
10/100 LNK/ACT	Amber	Light to indicate the port is running at 10/100Mbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.		

■ Per SFP Interface

LED	Color	Function		
1000 LNK/ACT	Green	Lights to indicate the port is running at 1000Mbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.		
100 LNK/ACT	Amber	Lights to indicate the port is running at 100Mbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.		

■ Per 1/10G SFP+ Interface (IGS-6325-24P4X)

LED	Color	Function		
1G/2.5G LNK/ACT	Green	Lights to indicate the port is running at 1Gbps or 2.5Gbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.		
10G LNK / ACT	Amber	Lights to indicate the port is running at 10Gbps and successfully established. Blinks to indicate that the switch is actively sending or receiving data over that port.		

IGS-6325-24UP4X

Figure 2-1-16: IGS-6325-24UP4X LEDs on Front Panel

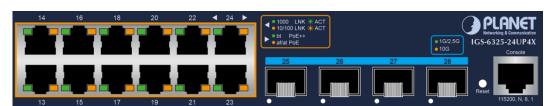

Figure 2-1-17: IGS-6325-24UP4X LEDs on Front Panel

LED Definition:

■ System and Power

LED	Color	Function		
DIDO	Red	Blinking	Blinking Indicating the DI and DO events	
ЫВО		Off:	No event	
R.O.*	Green	Lights to indicate Ring Owner is enabled.		
Ring	Green	Lights to indicate that the ERPS Ring has been created successfully.		
Alexan	Alarm Red		Lit: Indicating power failure or port problem.	
Alarm			Off: No failure	
B00	0	Lit:	Lit: Power 2 is connected.	
DC2	Green	Off:	Off: Power 2 is disconnected.	
D04	0	Lit:	Lit: Power 1 is connected	
DC1	Green	Off:	Power 1 is disconnected.	

■ Per 10/100/1000T RJ45 PoE++ Interfaces (Port 1 to Port 24)

Туре	LED	Color	Function	
	1G	Green	Lights:	To indicate the port is running at 1Gbps .
Data	LNK/ACT		Blinks:	To indicate that the switch is actively sending or receiving data over that port.
Data	10/100M LNK/ACT	Amber	Lights:	To indicate the port is running at 10/100Mbps .
			Blinks:	To indicate that the switch is actively sending or receiving data over that port.
PoE	IEEE 802.3bt Mode	Green	Lights	To indicate that the port is supplying power in IEEE 802.3bt mode.
	IEEE 802.3at Mode	Amber	Lights	To indicate that the port is supplying power in IEEE 802.3at mode.

■ Per 10GBASE-X SFP+ Interface (Port 25 to Port 28)

LED	Color	Function		
1G/2.5G	Green		To indicate the port is running in 1G/2.5Gbps speed and successfully established.	
LNK/ACT			To indicate that the Switch is actively sending or receiving data over that port.	
10G	Amber Lit:		To indicate the port is running in 10Gbps speed and successfully established.	
LNK/ACT			To indicate that the switch is actively sending or receiving data over that port.	

2.1.4 Wiring the AC Power Input

IGS-6325-20T4C4X and IGS-6325-20S4C4X

The front panels of the IGS-6325-20T4C4X and IGS-6325-20S4C4X indicate an AC inlet power socket, which accepts input power from 100 to 240V AC, 50/60Hz.

Figure 2-1-18: IGS-6325-20T4C4X AC inlet power socket

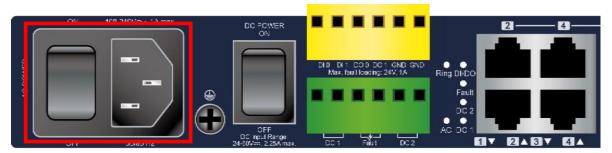

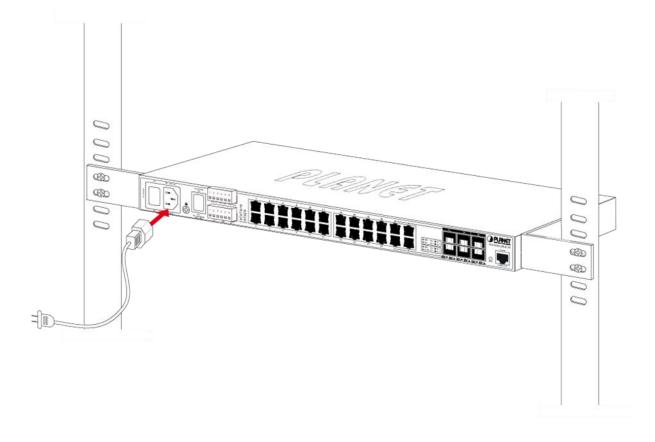

Figure 2-1-19: IGS-6325-20S4C4X AC inlet power socket

2.1.5 Wiring the DC Power Input

The 6-contact terminal block connector on the front panel of Industrial Managed Switch is used for two DC redundant power inputs. Please follow the steps below to insert the power wire.

IGS-6325-20T4C4X and IGS-6325-20S4C4X

1. Insert positive/negative DC power wires into Contacts 1 and 2 for DC POWER 1, or 5 and 6 for DC POWER 2.

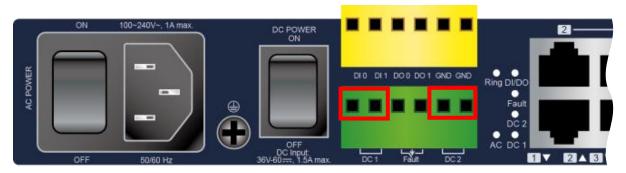

Figure 2-1-20: IGS-6325-20T4C4X DC power input

2. Tighten the wire-clamp screws for preventing the wires from loosening.

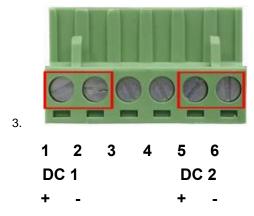

Figure 2-1-21 6-pin Terminal Block Power Wiring Input for IGS-6325-20T4C4X and IGS-325-20S4C4X

IGS-6325-24P4X and IGS-6325-24P4S

1. Insert positive/negative DC power wires into Contacts 1 and 2 for DC POWER 1, or 5 and 6 for DC POWER 2.

Figure 2-1-22: IGS-6325-24P4X and IGS-6325-24P4S DC power input

2. Tighten the wire-clamp screws for preventing the wires from loosening.

- 1. The wire gauge for the terminal block should be in the range of 12 ~ 24 AWG.
- 2. When performing any of the procedures like inserting the wires or tightening the wire-clamp screws, make sure the power is OFF to prevent from getting an electric shock.

IGS-6325-24UP4X

I. Insert positive/negative DC power wires into Contacts 1 and 2 for DC POWER 1, or 5 and 6 for DC POWER 2.

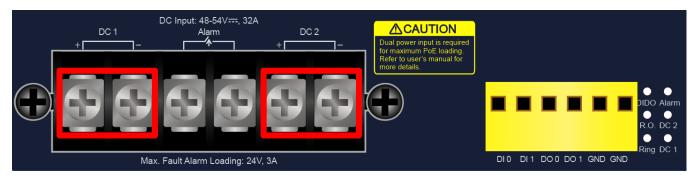

Figure 2-1-23: IGS-6325-24UP4X

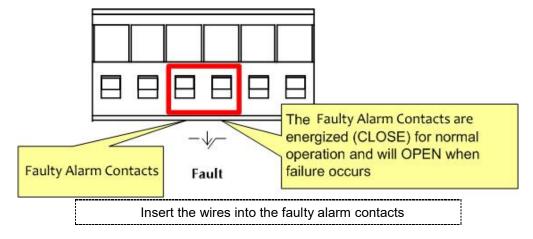

Tighten the wire-clamp screws for preventing the wires from loosening.

- 1. The wire gauge for the terminal block should be in the range of $12 \sim 14$ AWG.
- 2. When performing any of the procedures like inserting the wires or tightening the wire-clamp screws, make sure the power is OFF to prevent from getting an electric shock.

2.1.6 Wiring the Fault Alarm Contact

The fault alarm contacts are in the middle (3 & 4) of the terminal block connector as the picture shows below. Inserting the wires, the **Industrial Managed Switch** will detect the fault status of the power failure, or port link failure (available for managed model). The following illustration shows an application example for wiring the fault alarm contacts

- 1. The wire gauge for the terminal block should be in the range of 12 \sim 24 AWG.
- 2. When performing any of the procedures like inserting the wires or tighten the wire-clamp screws, make sure the power is OFF to prevent from getting an electric shock.

2.1.7 Wiring the Digital Input/Output

The 6-contact terminal block connector on the front panel of Industrial Managed Switch is used for Digital Input and Digital Output. Please follow the steps below to insert wire.

1. The Industrial Managed Switch offers two DI and DO groups. 1 and 2 are DI groups, 3 and 4 are DO groups, and 5 and 6 are GND (ground).

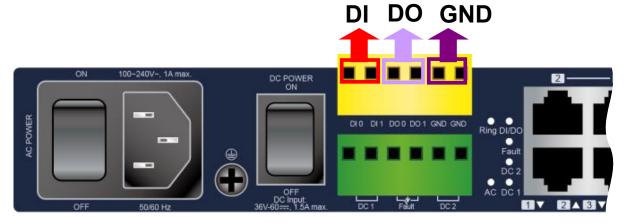

Figure 2-1-24 Wiring the DI and DO of IGS-6325-20T4C4X and IGS-6325-20S4C4X

Figure 2-1-25 Wiring the DI and DO of IGS-6325-24P4X and IGS-6325-24P4S

2. Tighten the wire-clamp screws for preventing the wires from loosening.

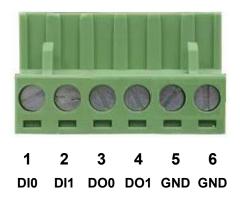

Figure 2-1-26 6-pin Terminal Block for DI and DO Wiring Input

3. There are two **Digital Input** groups for you to monitor two different devices. The following topology shows how to wire DI0 and DI1.

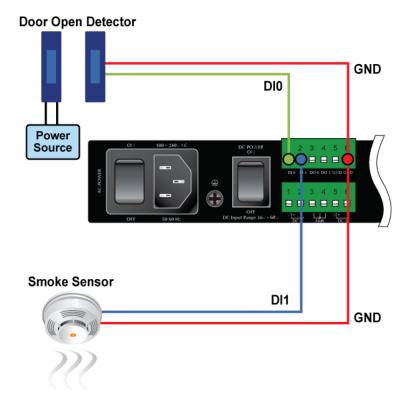

Figure 2-1-27 Wires DI0 and DI1 to Open Detector

4. There are two **Digital Output** groups for you to sense Industrial Managed Switch port failure or power failure and issue a high or low signal to external device. The following topology shows how to wire DO0 and DO1.

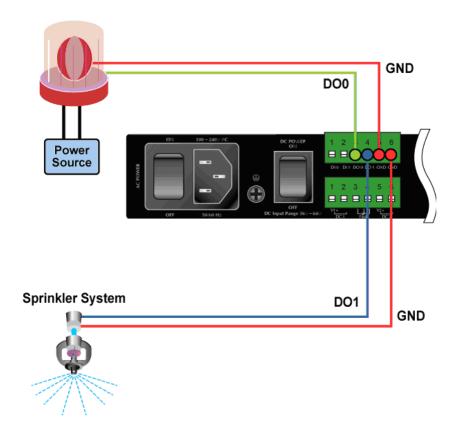

Figure 2-1-28 Wires DO0 and DO1 to Open Detector

2.2 Installing the Industrial Managed Switch

This section describes how to install your **Industrial Managed Switch** and make connections to the **Industrial Managed Switch**. Please read the following topics and perform the procedures in the order being presented. To install your **Industrial Managed Switch** on a desktop or shelf, simply complete the following steps.

In this paragraph, we will describe how to install the Industrial Managed Switch and the installation points attended to it.

2.2.1 Desktop Installation

To install the Industrial Managed Switch on desktop or shelf, please follow these steps:

Step 1: Attach the rubber feet to the recessed areas on the bottom of the Industrial Managed Switch.

Step 2: Place the Industrial Managed Switch on the desktop or the shelf near an AC power source, as shown in Figure 2-2-1.

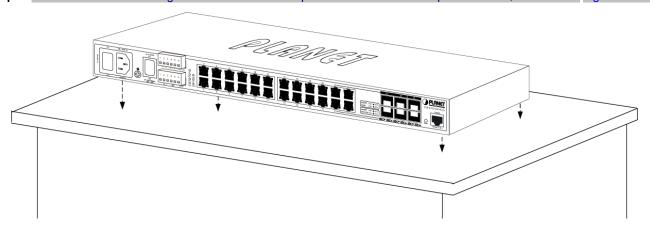

Figure 2-2-1 Place the Industrial Managed Switch on the Desktop

Step 3: Keep enough ventilation space between the Industrial Managed Switch and the surrounding objects.

When choosing a location, please keep in mind the environmental restrictions discussed in Chapter 1, Section 4, and specifications.

Step4: Connect the Industrial Managed Switch to network devices.

Connect one end of a standard network cable to the 10/100/1000 RJ45 ports on the front of the Industrial Managed Switch.

Connect the other end of the cable to the network devices such as printer server, workstation or router.

Connection to the Industrial Managed Switch requires UTP Category 5e network cabling with RJ45 tips. For more information, please see the Cabling Specification in Appendix A.

Step 5: Supply power to the Industrial Managed Switch.

Connect one end of the power cable to the Industrial Managed Switch.

Connect the power plug of the power cable to a standard wall outlet.

When the Industrial Managed Switch receives power, the Power LED should remain solid Green.

2.2.2 Rack Mounting

To install the Industrial Managed Switch in a 19-inch standard rack, please follow the instructions described below.

- Step 1: Place the Industrial Managed Switch on a hard flat surface, with the front panel positioned towards the front side.
- **Step 2:** Attach the rack-mount bracket to each side of the Industrial Managed Switch with supplied screws attached to the package.

Figure 2-2-2 shows how to attach brackets to one side of the Industrial Managed Switch.

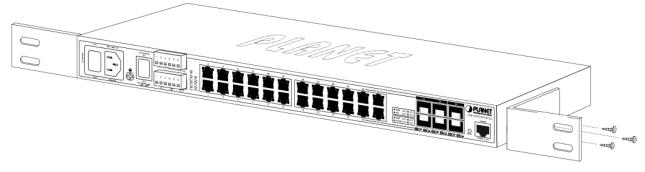

Figure 2-2-2 Attach Brackets to the Industrial Managed Switch.

You must use the screws supplied with the mounting brackets. Damage caused to the parts by using incorrect screws would invalidate the warranty.

- Step 3: Secure the brackets tightly.
- Step 4: Follow the same steps to attach the second bracket to the opposite side.
- Step 5: After the brackets are attached to the Industrial Managed Switch, use suitable screws to securely attach the brackets to the rack, as shown in Figure 2-2-3.

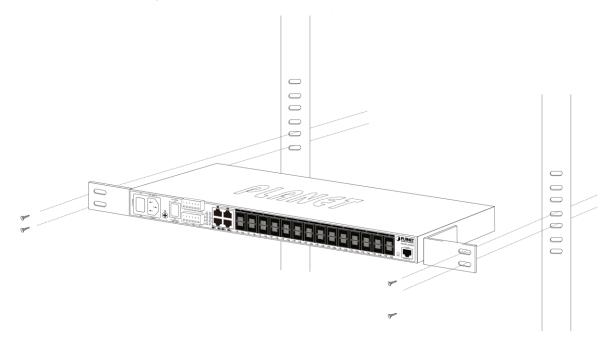

Figure 2-2-3 Mounting the Industrial Managed Switch on a Rack

Step6: Proceed with Steps 4 and 5 of section 2.2.1 Desktop Installation to connect the network cabling and supply power to the Industrial Managed Switch.

2.3 Cabling

■ 10/100/1000BASE-T and 100BASE-FX/1000BASE-SX/LX

All 10/100/1000BASE-T ports come with auto-negotiation capability. They automatically support 1000BASE-T, 100BASE-TX and 10BASE-T networks. Users only need to plug a working network device into one of the 10/100/1000BASE-T ports, and then turn on the **Industrial Managed Switch**. The port will automatically run at 10Mbps, 20Mbps, 100Mbps or 2000Mbps and 1000Mbps or 2000Mbps after negotiating with the connected device. The **Industrial Managed Switch** has SFP interfaces that support 100/1000Mbps dual speed mode (Optional multi-mode/single-mode 100BASE-FX/1000BASE-SX/LX SFP module)

■ Cabling

Each 10/100/1000BASE-T port uses RJ45 sockets -- similar to phone jacks -- for connection of unshielded twisted-pair cable (UTP). The IEEE 802.3/802.3u 802.3ab Fast/Gigabit Ethernet standard requires Category 5 UTP for 100Mbps 100BASE-TX. 10BASE-T networks can use Cat.3, 4, 5 or 1000BASE-T uses 5/5e/6 UTP (see table below). Maximum distance is 100 meters (328 feet). The 100BASE-FX/1000BASE-SX/LX SFP slot is used as LC connector with optional SFP module. Please see table below and know more about the cable specifications.

Port Type	Cable Type	Connector
10BASE-T	Cat 3, 4, 5, 2-pair	RJ45
100BASE-TX	Cat.5 UTP, 2-pair	RJ45
1000BASE-T	Cat.5/5e/6 UTP, 2-pair	RJ45
100BASE-FX	50/125μm or 62.5 / 125μm multi-mode 9/125μm single-mode	LC (multi/single mode)
1000BASE-SX/LX	50/125μm or 62.5 / 125μm multi-mode 9/125μm single-mode	LC (multi/single mode)
10GBASE-SR/LR	50/125µm or 62.5 / 125µm multi-mode 9/125µm single-mode	LC (multi/single mode)

Any Ethernet devices like hubs/PCs can be connected to the **Industrial Managed Switch** by using straight-through wires. The two 10/100/1000Mbps ports are auto-MDI/MDI-X, which can be used on straight-through or crossover cable.

2.3.1 Installing the SFP Transceiver

The sections describe how to insert an SFP/SFP+ transceiver into an SFP/SFP+ slot. The SFP/SFP+ transceivers are hot-pluggable and hot-swappable. You can plug in and out the transceiver to/from any SFP/SFP+ port without having to power down the **Industrial Managed Switch** as Figure 2-3-1 appears.

Follow all the SFP installation steps as shown in the example.

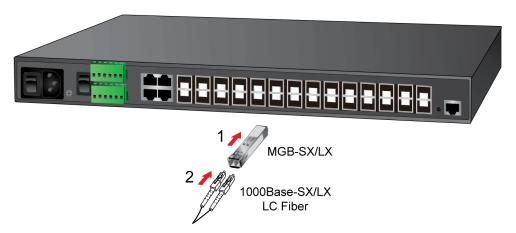

Figure 2-3-1: Plug in the SFP/SFP+ Transceiver

■ Approved PLANET SFP/SFP+ Transceivers

PLANET **Industrial Managed Switch** supports both single mode and multi-mode SFP transceivers. The following list of approved PLANET SFP/SFP+ transceivers is correct at the time of publication:

Fast Ethernet Transceiver (100BASE-X SFP)

Model	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (nm)	Operating Temp.
MFB-FX	100	LC	Multi Mode	2km	1310nm	0 ~ 60 degrees C
MFB-F20	100	LC	Single Mode	20km	1310nm	0 ~ 60 degrees C
MFB-F40	100	LC	Single Mode	40km	1310nm	0 ~ 60 degrees C
MFB-F60	100	LC	Single Mode	60km	1310nm	0 ~ 60 degrees C
MFB-TFX	100	LC	Multi Mode	2km	1310nm	-40 ~ 75 degrees C
MFB-TF20	100	LC	Single Mode	20km	1310nm	-40 ~ 75 degrees C

Fast Ethernet Transceiver (100BASE-BX, Single Fiber Bi-directional SFP)

Model	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (TX/RX)	Operating Temp.
MFB-FA20	100	WDM(LC)	Single Mode	20km	1310nm/1550nm	0 ~ 60 degrees C
MFB-FB20	100	WDM(LC)	Single Mode	20km	1550nm/1310nm	0 ~ 60 degrees C
MFB-TFA20	100	WDM(LC)	Single Mode	20km	1310nm/1550nm	-40 ~ 75 degrees C
MFB-TFB20	100	WDM(LC)	Single Mode	20km	1550nm/1310nm	-40 ~ 75 degrees C
MFB-TFA40	100	WDM(LC)	Single Mode	40km	1310nm/1550nm	-40 ~ 75 degrees C
MFB-TFB40	100	WDM(LC)	Single Mode	40km	1550nm/1310nm	-40 ~ 75 degrees C

Gigabit Ethernet Transceiver (1000BASE-X SFP)

Model	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (nm)	Operating Temp.
MGB-GT	1000	Copper		100m		0 ~ 60 degrees C
MGB-SX	1000	LC	Multi Mode	550m	850nm	0 ~ 60 degrees C
MGB-SX2	1000	LC	Multi Mode	2km	1310nm	0 ~ 60 degrees C
MGB-LX	1000	LC	Single Mode	20km	1310nm	0 ~ 60 degrees C
MGB-L40	1000	LC	Single Mode	40km	1310nm	0 ~ 60 degrees C
MGB-L80	1000	LC	Single Mode	80km	1550nm	0 ~ 60 degrees C
MGB-L120	1000	LC	Single Mode	120km	1550nm	0 ~ 60 degrees C
MGB-TSX	1000	LC	Multi Mode	550m	850nm	-40 ~ 75 degrees C
MGB-TLX	1000	LC	Single Mode	20km	1310nm	-40 ~ 75 degrees C
MGB-TL40	1000	LC	Single Mode	40km	1310nm	-40 ~ 75 degrees C
MGB-TL40	1000	LC	Single Mode	80km	1550nm	-40 ~ 75 degrees C

Gigabit Ethernet Transceiver (1000BASE-BX, Single Fiber Bi-directional SFP)

Model	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (TX/RX)	Operating Temp.
MGB-LA10	1000	WDM(LC)	Single Mode	10km	1310nm/1550nm	0 ~ 60 degrees C
MGB-LB10	1000	WDM(LC)	Single Mode	10km	1550nm/1310nm	0 ~ 60 degrees C
MGB-LA20	1000	WDM(LC)	Single Mode	20km	1310nm/1550nm	0 ~ 60 degrees C
MGB-LB20	1000	WDM(LC)	Single Mode	20km	1550nm/1310nm	0 ~ 60 degrees C
MGB-LA40	1000	WDM(LC)	Single Mode	40km	1310nm/1550nm	0 ~ 60 degrees C
MGB-LB40	1000	WDM(LC)	Single Mode	40km	1550nm/1310nm	0 ~ 60 degrees C
MGB-LA60	1000	WDM(LC)	Single Mode	60km	1310nm/1550nm	0 ~ 60 degrees C
MGB-LB60	1000	WDM(LC)	Single Mode	60km	1550nm/1310nm	0 ~ 60 degrees C
MGB-TLA10	1000	WDM(LC)	Single Mode	10km	1310nm/1550nm	-40 ~ 75 degrees C
MGB-TLB10	1000	WDM(LC)	Single Mode	10km	1550nm/1310nm	-40 ~ 75 degrees C
MGB-TLA20	1000	WDM(LC)	Single Mode	20km	1310nm/1550nm	-40 ~ 75 degrees C
MGB-TLB20	1000	WDM(LC)	Single Mode	20km	1550nm/1310nm	-40 ~ 75 degrees C
MGB-TLA40	1000	WDM(LC)	Single Mode	40km	1310nm/1550nm	-40 ~ 75 degrees C
MGB-TLB40	1000	WDM(LC)	Single Mode	40km	1550nm/1310nm	-40 ~ 75 degrees C
MGB-TLA60	1000	WDM(LC)	Single Mode	60km	1310nm/1550nm	-40 ~ 75 degrees C
MGB-TLB60	1000	WDM(LC)	Single Mode	60km	1550nm/1310nm	-40 ~ 75 degrees C

10Gbps SFP+ (10G Ethernet/10GBASE)

Model	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (nm)	Operating Temp.
MTB-SR	10G	LC	Multi Mode	Up to 300m	850nm	0 ~ 60 degrees C
MTB-LR	10G	LC	Single Mode	10km	1310nm	0 ~ 60 degrees C
MTB-TSR	10G	Dual LC/UPC	Multi Mode	Up to 300m	850nm	-40 ~ 85 degree C
MTB-TLR	10G	Dual LC/UPC	Single Mode	10km	1310nm	-40 ~ 85 degree C
MTB-TSR2	10G	Dual LC/UPC	Single Mode	2km	1310nm	-40 ~ 85 degree C

MTB-TLR20	10G	Dual LC/UPC	Single Mode	20km	1310nm	-40 ~ 85 degree C
MTB-TLR40	10G	Dual LC/UPC	Single Mode	40km	1310nm	-40 ~ 85 degree C
MTB-TLR60	10G	Dual LC/UPC	Single Mode	60km	1550nm	-40 ~ 85 degree C
MTB-TLA20	10G	Simplex LC/UPC	Single Mode	20km	TX: 1270nm RX: 1330nm	-40 ~ 85 degree C
MTB-TLB20	10G	Simplex LC/UPC	Single Mode	20km	TX: 1330nm RX: 1270nm	-40 ~ 85 degree C
MTB-TLA40	10G	Simplex LC/UPC	Single Mode	40km	TX: 1270nm RX: 1330nm	-40 ~ 85 degree C
MTB-TLB40	10G	Simplex LC/UPC	Single Mode	40km	TX: 1330nm RX: 1270nm	-40 ~ 85 degree C
MTB-TLA60	10G	Simplex LC/UPC	Single Mode	60km	TX: 1270nm RX: 1330nm	-40 ~ 85 degree C
MTB-TLB60	10G	Simplex LC/UPC	Single Mode	60km	TX: 1330nm RX: 1270nm	-40 ~ 85 degree C

- It is recommended to use PLANET SFP on the Industrial Managed Switch. If you insert an SFP/SFP+ transceiver that is not supported, the Industrial Managed Switch will not recognize it.
- 2. Please choose the SFP/SFP+ transceiver which can be operated at the temperature range of -40~75 degrees C if the switch device is working in a 0~50 degrees C temperature environment.
- Before we connect the Industrial Managed Switch to the other network device, we have to make sure both sides of the SFP transceivers are with the same media type, for example: 1000BASE-SX to 1000BASE-SX, 1000BASE-LX to 1000BASE-LX.
- 2. Check whether the fiber-optic cable type matches with the SFP transceiver requirement.
 - To connect to 1000BASE-SX SFP transceiver, please use the multi-mode fiber cable with one side being the male duplex LC connector type.
 - > To connect to 1000BASE-LX SFP transceiver, please use the single-mode fiber cable with one side being the male duplex LC connector type.

Connect the fiber cable

- 1. Insert the duplex LC connector into the SFP/SFP+ transceiver.
- 2. Connect the other end of the cable to a device with SFP/SFP+ transceiver installed.
- 3. Check the LNK/ACT LED of the SFP/SFP+ slot on the front of the Managed Switch. Ensure that the SFP/SFP+ transceiver is operating correctly.
- 4. Check the Link mode of the SFP/SFP+ port if the link fails. To function with some fiber-NICs or Media Converters, user has to set the port Link mode to "10G FDX", "1000M FDX" or "100M FDX".

2.3.2 Removing the SFP/SFP+ Transceiver

- Make sure there is no network activity by consulting or checking with the network administrator. Or through the management interface of the switch/converter (if available) to disable the port in advance.
- 2. Remove the fiber optic cable gently.
- 3. Turn the lever of the SFP transceiver to a horizontal position.
- 4. Pull out the module gently through the lever.

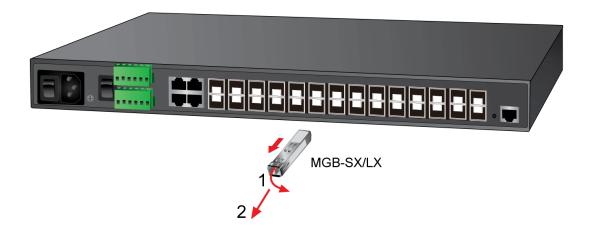

Figure 2-3-2: Pull out the SFP/SFP+ Transceiver Module

Never pull out the module without pulling the lever or the push bolts on the module. Directly pulling out the module with force could damage the module and SFP module slot of the device.

3. SWITCH MANAGEMENT

This chapter explains the methods that you can use to configure management access to the **Industrial Managed Switch**. It describes the types of management applications and the communication and management protocols that deliver data between your management device (workstation or personal computer) and the system. It also contains information about port connection options.

This chapter covers the following topics:

- Requirements
- Management Access Overview
- Remote Telnet Access
- Web Management Access
- SNMP Access
- Standards, Protocols, and Related Reading

3.1 Requirements

- A workstation operating on Windows 10/11, macOS 10.11, Ubuntu Linux, or any modern platform that supports **TCP/IP** protocols is compatible..
- Workstation is installed with Ethernet NIC (Network Interface Card)
- Serial Port (Terminal)
 - The above PC comes with COM Port (DB9/RS232) or USB-to-RS232 converter
- Ethernet Port
 - Network cables -- Use standard network (UTP) cables with RJ45 connectors.
- The above workstation is installed with Web browser and JAVA runtime environment Plug-in

It is recommended to use Google Chrome, Microsoft Edge or other modern internet browsers to access Industrial Managed Switch.

3.2 Management Access Overview

The Industrial Managed Switch gives you the flexibility to access and manage it using any or all of the following methods:

- Remote Telnet Interface
- Web browser Interface
- An external SNMP-based network management application

The remote Telnet and Web browser interfaces are embedded in the **Industrial Managed Switch** software and are available for immediate use. Each of these management methods has their own advantages. Table 3-1 compares the three management methods.

Method	Advantages	Disadvantages
Console	No IP address or subnet needed	Must be near the switch or use dial-up
	Text-based	connection
	ProComm Plus, putty, Tera term	Not convenient for remote users
	Secure	Modem connection may prove to be unreliable
		or slow
Remote	Text-based	Security can be compromised (hackers need
Telnet	ProComm Plus, putty, Tera term	only know the IP address)
	Can be accessed from any location	
Web Browser	Ideal for configuring the switch	Security can be compromised (hackers need
	remotely	only know the IP address and subnet mask)
	Compatible with all popular browsers	May encounter lag times on poor connections
	Can be accessed from any location	
	Most visually appealing	
SNMP Agent	Communicates with switch functions at	Requires SNMP manager software
	the MIB level	Least visually appealing of all three methods
	Based on open standards	Some settings require calculations
		Security can be compromised (hackers need
		only know the community name)

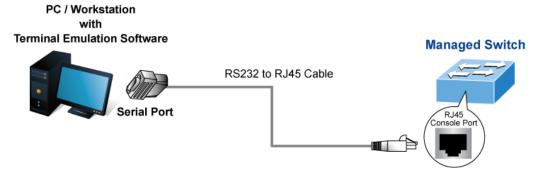

Table 3-1: Management Methods Comparison

3.3 CLI Mode Management

There are two ways for CLI mode management, one is remote telnet and the other operated from console port. Remote telnet is an IP-based protocol and console port is for user to operate the Industrial Managed Switch locally only; however, their operations are the same.

The command line user interface is for performing system administration, such as displaying statistics or changing option settings. When this method is used, you can access the **Industrial Managed Switch** remote telnet interface from personal computer or workstation in the same Ethernet environment as long as you know the current IP address of the **Industrial Managed Switch**.

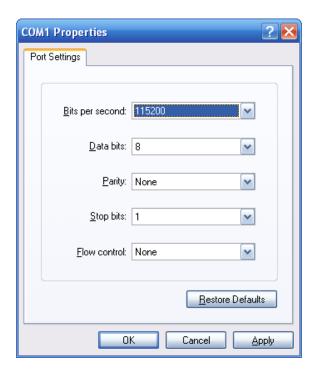

Direct Access

Direct access to the administration console is achieved by directly connecting a terminal or a PC equipped with a terminal-emulation program (such as HyperTerminal, ProComm Plus, putty, Tera term) to the Managed Switch console (serial) port. When using this management method, a **straight DB9 RS-232 cable** is required to connect the switch to the PC. After making this connection, configure the terminal-emulation program to use the following parameters:

The default parameters are:

- 115200 bps baud rate
- 8 data bits
- No parity
- 1 stop bit

You can change these settings, if desired, after you log on. This management method is often preferred because you can remain connected and monitor the system during system reboots. Also, certain error messages are sent to the serial port, regardless of the interface through which the associated action was initiated. A Macintosh or PC attachment can use any terminal-emulation program for connecting to the terminal serial port. A workstation attachment under UNIX can use an emulator.

3.3.1 Logging on to the Console

Once the terminal has been connected to the device, power on the Industrial Managed Switch and the terminal will display "running testing procedures".

Then, the following message asks to log in user name and password. The factory default user name and password are shown as follows as the login screen in Figure 3-1 appears

User Name: admin
Password: admin

Figure 3-1: Console Login Screen

The user can now enter commands to manage the Industrial Managed Switch. For a detailed description of the commands, please refer to the following chapters.

- For security reason, please change and memorize the new password after this first setup.
- 2. Only accept command in lowercase letter under console interface.

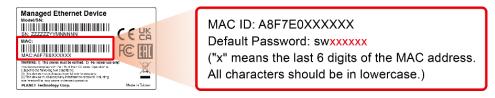

The following console screen is based on the firmware version of June of 2024 or after.

Username: admin

Password: sw + the last 6 characters of the MAC ID in lowercase

Find the MAC ID on your device label. The default password is "sw" followed by the last six lowercase characters of the MAC ID.

Enter the default username and password, then **set a new password** according to the rule-based prompt and confirm it. Upon success, press any key to return to the login prompt. Log in with "**admin**" and the "**new password**" to access the CLI.

- 1. For security reason, please change and memorize the new password after this first setup.
- 2. Only accept command in lowercase letter under console interface.

Remote Telnet

In Windows system, you may click "Start" and then choose "Accessories" and "Command Prompt". Please input "telnet 192.168.0.100" and press "enter' from your keyboard. You will see the following screen appears as Figure 3-2 shows.

Figure 3-2: Remote Telnet Interface Main Screen of Industrial Managed Switch

3.4 Web Management

The Industrial Managed Switch offers management features that allow users to manage the Industrial Managed Switch from anywhere on the network through a standard browser such as Microsoft Internet Explorer. After you set up your IP address for the Industrial Managed Switch, you can access the Industrial Managed Switch's Web interface applications directly in your Web browser by entering the IP address of the Industrial Managed Switch.

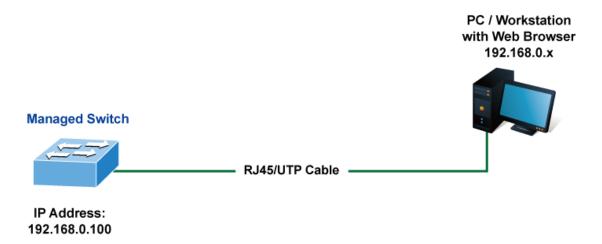

Figure 3-3: Web Management

You can then use your Web browser to list and manage the **Industrial Managed Switch** configuration parameters from one central location; the Web Management requires **Google Chrome**, **Microsoft Edge or Firefox** browsers.

Figure 3-4: Web Main Screen of Industrial Managed Switch

3.5 SNMP-based Network Management

You can use an external SNMP-based application to configure and manage the **Industrial Managed Switch**, such as SNMP Network Manager, HP Openview Network Node Management (NNM) or What's Up Gold. This management method requires the SNMP agent on the **Industrial Managed Switch** and the SNMP Network Management Station to use the **same community string**. This management method, in fact, uses two community strings: the **get community** string and the **set community** string.

If the SNMP Network Management Station only knows the set community string, it can read and write to the MIBs. However, if it only knows the get community string, it can only read MIBs. The default gets and sets community strings for the **Industrial**Managed Switch are public.

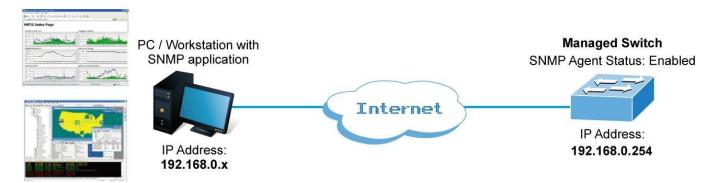

Figure 3-5: SNMP Management

3.6 PLANET Smart Discovery Utility

To easily list the **Industrial Managed Switch** in your Ethernet environment, the Planet Smart Discovery Utility which can be downloaded from PLANET website is an ideal solution. The following install instructions guide you to running the Planet Smart Discovery Utility.

- 1. Open the Planet Smart Discovery Utility in administrator PC.
- 2. Run this utility and the following screen appears.

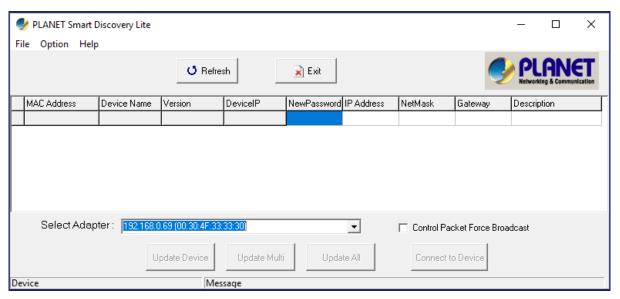

Figure 3-6: Planet Smart Discovery Utility Screen

If there are two LAN cards or above in the same administrator PC, choose a different LAN card by using the "Select Adapter" tool.

3. Press the "Refresh" button for the currently connected devices in the discovery list as the screen is shown as follows.

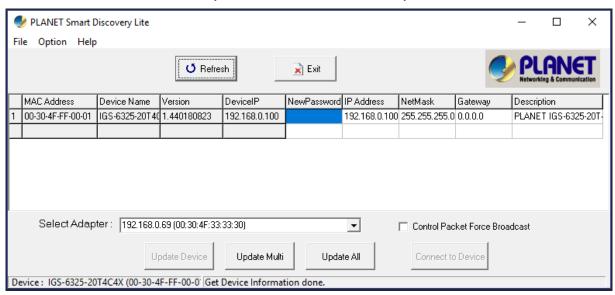

Figure 3-7: Planet Smart Discovery Utility Screen

- 1. This utility shows all the necessary information from the devices, such as MAC address, device name, firmware version and device IP subnet address. A new password, IP subnet address and description can be assigned to the devices.
- 2. After setup is completed, press the "Update Device", "Update Multi" or "Update All" button to take effect. The functions of the 3 buttons above are shown below:
 - Update Device: Use the current setting on one single device.
 - Update Multi: Use the current setting on choose multi-devices.
 - Update All: Use the current setting on whole devices in the list.

The same functions mentioned above also can be found in "Option" tools bar.

- 3. To click the "Control Packet Force Broadcast" function, it allows new setting value to be assigned to the Web Smart Switch under a different IP subnet address.
- 4. Press the "Connect to Device" button and then the Web login screen appears in Figure 3-7.
- 5. Press the "Exit" button to shut down Planet Smart Discovery Utility.

4. WEB CONFIGURATION

This section introduces the configuration and functions of the Web-based management.

About Web-based Management

The **Industrial Managed Switch** offers management features that allow users to manage the **Industrial Managed Switch** from anywhere on the network through a standard browser such as Microsoft Internet Explorer.

The Web-based Management supports Google Chrome or Microsoft Edge. It is based on Java Applets with an aim to reducing network bandwidth consumption, enhancing access speed and presenting an easy viewing screen.

By default, Google Chrome or Microsoft Edge does not allow Java Applets to open sockets. The user has to explicitly modify the browser setting to enable Java Applets to use network ports.

The **Industrial Managed Switch** can be configured through an Ethernet connection, making sure the manager PC must be set to the same the IP subnet address as the **Industrial Managed Switch**. For example, the default IP address of the Industrial Managed Switch is 192.168.0.100, then the manager PC should be set to 192.168.0.x (where x is a number between 1 and 254, except 100), and the default subnet mask is 255.255.255.0.

If you have changed the default IP address of the **Industrial Managed Switch** to 192.168.1.1 with subnet mask 255.255.255.0 via console, then the manager PC should be set to 192.168.1.x (where x is a number between 2 and 254) to be able to do the related configuration on manager PC.

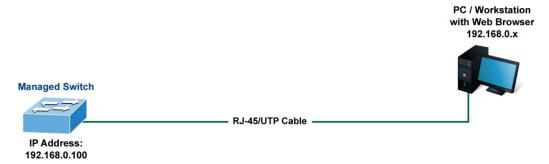

Figure 4-1-1: Web Management

Logging on to the Industrial Managed Switch

Use Google Chrome or Microsoft Edge Web browser. Enter the factory-default IP address to access the Web interface.
 The factory-default IP address is as follows:

http://192.168.0.100

2. When the following login screen appears, please enter the default username "admin" with password "admin" (or the username/password you have changed via console) to log in the main screen of Industrial Managed Switch. The login screen in Figure 4-1-2 appears.

Figure 4-1-2: Login Screen

Default User name: admin
Default Password: admin

The following web screen is based on the firmware version of June of 2024 or after.

3. When the following dialog box appears, please enter the default user name "admin" and and password.

Default Username: admin

Default Password: sw + the last 6 characters of the MAC ID in lowercase

MAC ID: A8F7E0XXXXXX
Default Password: swxxxxxx

("x" means the last 6 digits of the MAC address. All characters should be in lowercase.)

4. After logging in, you will be prompted to change the initial password to a permanent one.

192.168.0.100 says

You are required to change and store a new password to be able to get into the switch.

Please store your new password in a safe, retrievable place for safe keeping.

Once configured, also store a copy of your Config File in a safe, retrievable place for safe keeping.

Change Password

New Password			
Password		show password	
Retype Password			
	Apply Reset		

The password must contain 8-31 characters, including upper case, lower case, numerals and other symbols. Please note, spaces (blanks) are not accepted.

After entering the username and password, the main screen appears as Figure 4-1-3.

Figure 4-1-3: Default Main Page

Now, you can use the Web management interface to continue the switch management or manage the **Industrial Managed**Switch by Web interface. The Switch Menu on the left of the web page lets you access all the commands and statistics the Industrial Managed Switch provides.

- 1. It is recommended to use Google Chrome or Microsoft Edge to access **Industrial Managed Switch**.
- 2. The changed IP address takes effect immediately after clicking on the **Save** button. From now on, you need to use the new IP address to access the Internet.

- 3. For security reason, please change and memorize the new password after this first setup.
- 4. Only accept command in lowercase letter.

4.1 Main Web page

The **Industrial Managed Switch** provides a Web-based browser interface for configuring and managing it. This interface allows you to access the **Industrial Managed Switch** using the Web browser of your choice. This chapter describes how to use the **Industrial Managed Switch**'s Web browser interface to configure and manage it.

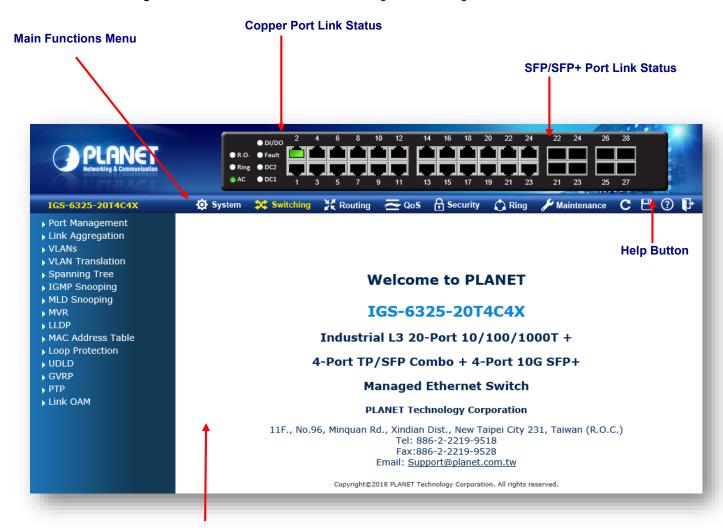

Figure 4-1-4: Main page

Main Screen

Panel Display

The web agent displays an image of the **Industrial Managed Switch**'s ports. The Mode can be set to display different information for the ports, including Link up or Link down. Clicking on the image of a port opens the **Port Statistics** page. The port states are illustrated as follows:

State	Disabled	Down	Link
RJ45 Ports			
SFP Ports			

Main Menu

Using the onboard web agent, you can define system parameters, manage and control the **Industrial Managed Switch**, and all its ports, or monitor network conditions. Via the Web-Management, the administrator can set up the **Industrial Managed Switch** by selecting the functions listed in the Main Function. The screen in Figure 4-1-5 appears.

Figure 4-1-5: Industrial Managed Switch Main Functions Menu

4.2 System

Use the System menu items to display and configure basic administrative details of the **Industrial Managed Switch**. Under the System, the following topics are provided to configure and view the system information. This section has the following items:

System Information	The Industrial Managed Switch system information is provided here.
IP Configuration	Configure the IPv4/IPv6 interface and IP routes of the Industrial Managed
	Switch on this page.
IP Status	This page displays the status of the IP protocol layer. The status is defined
	by the IP interfaces, the IP routes and the neighbor cache (ARP cache)
	status.
Users Configuration	This page provides an overview of the current users. Currently the only way
	to login as another user on the web server is to close and reopen the
	browser.
Privilege Levels	This page provides an overview of the privilege levels.
NTP Configuration	Configure NTP server on this page.
Time Configuration	Configure time parameter on this page.
UPnP	Configure UPnP on this page.
DHCP Relay	Configure DHCP Relay on this page.
DHCP Relay Statistics	This page provides statistics for DHCP relay.
CPU Load	This page displays the CPU load, using an SVG graph.
System Log	The system log information of the Industrial Managed Switch system is
	provided here.
Detailed Log	The detailed log information of the Industrial Managed Switch system is
	provided here.
Remote Syslog	Configure remote syslog on this page.
SMTP Configuration	Configure SMTP parameters on this page.
Digital Input/Output	Configure digital input and output on this page.
Fault Alarm	Configure fault alarm on this page.
SNMP	Configure SNMP parameters on this page
RMON	Configure the RMON parameters on this page
DHCP server	Configure the DHCP server on this page
Industrial Protocol	Configure the Modbus TCP Mode on this page
Remote Management	Configure remote NMS controller and CloudViewer app

4.2.1 Management

4.2.1.1 System Information

The System Information page provides information for the current device information. System Information page helps a switch administrator to identify the hardware MAC address, software version and system uptime. The screen in Figure 4-2-1-1 appears.

Syste	em Information		
	System		
Contact	100 0225 2074049		
Name Location	IGS-6325-20T4C4X		
	Hardware		
MAC Address	00-30-4f-ff-00-01 DC PWR1 :OFF		
Power Status	DC PWR2 :OFF AC PWR :ON		
Temperature	41.0 C - 105.0 F		
	Time		
System Date	1970-01-01 Thu 00:19:20+00:00		
System Uptime	0d 00:19:20		
Software			
Software Version	1.440180823		
Software Date	2018-08-23T11:46:17+08:00		
Auto-refresh Refresh			

Figure 4-2-1-1: System Information Page Screenshot

The page includes the following fields:

Object	Description	
• Contact	The system contact configured in SNMP System Information System Contact.	
• Name	The system name configured in SNMP System Information System Name.	
• Location	The system location configured in SNMP System Information System Location.	
MAC Address	The MAC Address of this Industrial Managed Switch.	
Power Status	The status of power input	
Temperature	Indicates chipset temperature.	
System Date	The current (GMT) system time and date. The system time is obtained through the configured NTP Server, if any.	
System Uptime	The period of time the device has been operational.	
Software Version	The software version of the Industrial Managed Switch.	
Software Date	The date when the Industrial Managed Switch software was produced.	

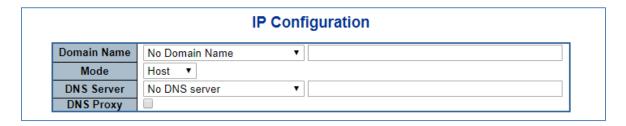

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

4.2.1.2 IP Configuration

The IP Configuration includes the IP Configuration, IP Interface and IP Routes. The configured column is used to view or change the IP configuration. The maximum number of interfaces supported is 128 and the maximum number of routes is 128. The screen in Figure 4-2-1-2 appears.

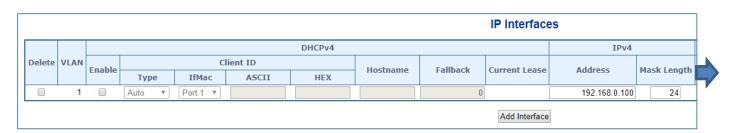

Figure 4-2-1-2: IP Configuration Page Screenshot

The current column is used to show the active IP configuration.

Object		D 10
Object		Description
• IP Configurations	Mode	Configure whether the IP stack should act as a Host or a Router. In
		Host mode, IP traffic between interfaces will not be routed. In Router
		mode traffic is routed between all interfaces.
	DNS Server	This setting controls the DNS name resolution done by the switch.
		There are four servers available for configuration, and the index of
		the server presents the preference (less index has higher priority) in
		doing DNS name resolution.
		System selects the active DNS server from configuration in turn, if
		the preferred server does not respond in five attempts.
		The following modes are supported:
		■ No DNS server
		No DNS server will be used.
		■ Configured IPv4
		Explicitly provide the valid IPv4 unicast address of
		the DNS Server in dotted decimal notation.
		Make sure the configured DNS server could be
		reachable (e.g. via PING) for activating DNS
		service.
		■ Configured IPv6
		Explicitly provide the valid IPv6 unicast (except link
		local) address of the DNS Server.
		Make sure the configured DNS server could be
		reachable (e.g. via PING6) for activating DNS
		service.
		■ From any DHCPv4 interfaces
		The first DNS server offered from a DHCPv4 lease
		to a DHCPv4-enabled interface will be used.
		■ From this DHCPv4 interface
		Specify from which DHCPv4-enabled interface a
		provided DNS server should be preferred.
		■ From any DHCPv6 interfaces
		The first DNS server offered from a DHCPv6 lease to a
		DHCPv6-enabled interface will be used.
		■ From this DHCPv6 interface
		Specify from which DHCPv6-enabled interface a provided
		DNS server should be preferred
	DNS Proxy	When DNS proxy is enabled, system will relay DNS requests to the
	DITOTTONY	Tribil Dito ploxy is chabled, system will letay Dito requests to the

	<u> </u>		
			currently configured DNS server, and reply as a DNS resolver to the
			client devices on the network.
• IP Interface	Delete		Select this option to delete an existing IP interface.
	VLAN		The VLAN associated with the IP interface. Only ports in this VLAN
			will be able to access the IP interface. This field is only available for
			input when creating a new interface.
	DHCPv4	Enabled	Enable the DHCPv4 client by checking this box. If this option is
			enabled, the system will configure the IPv4 address and mask of the
			interface using the DHCPv4 protocol. The DHCPv4 client will
			announce the configured System Name as hostname to provide DNS
			lookup.
		Fallback	The number of seconds for trying to obtain a DHCP lease. After this
			period expires, a configured IPv4 address will be used as IPv4
			interface address. A value of zero disables the fallback mechanism,
			such that DHCP will keep retrying until a valid lease is obtained.
			Legal values are 0 to 4294967295 seconds.
		Current	For DHCP interfaces with an active lease, this column shows the
		Lease	current interface address, as provided by the DHCP server.
	IPv4	Address	The IPv4 address of the interface in dotted decimal notation.
			If DHCP is enabled, this field configures the fallback address. The
			field may be left blank if IPv4 operation on the interface is not desired
			- or no DHCP fallback address is desired.
		Mask Length	The IPv4 network mask, in number of bits (prefix length). Valid values
			are between 0 and 30 bits for an IPv4 address.
			If DHCP is enabled, this field configures the fallback address network
			mask. The field may be left blank if IPv4 operation on the interface is
			not desired - or no DHCP fallback address is desired.
	DHCPv6	Enable	Enable the DHCPv6 client by checking this box. If this option is
			enabled, the system will configure the IPv6 address of the interface
			using the DHCPv6 protocol.
		Rapid	Enable the DHCPv6 Rapid-Commit option by checking this box. If
		Commit	this option is enabled, the DHCPv6 client terminates the waiting
			process as soon as a Reply message with a Rapid Commit option is
			received.
			This option is only manageable when DHCPv6 client is enabled.
		Current	For DHCPv6 interface with an active lease, this column shows the
		Lease	interface address provided by the DHCPv6 server.
	IDec		
	IPv6	Address	The IPv6 address of the interface. An IPv6 address is in 128-bit
			records represented as eight fields of up to four hexadecimal digits
			with a colon separating each field (:). For

		l	
			example, fe80::215:c5ff:fe03:4dc7. The symbol :: is a special syntax
			that can be used as a shorthand way of representing multiple 16-bit
			groups of contiguous zeros; but it can appear only once.
			System accepts the valid IPv6 unicast address only, except IPv4-
			Compatible address and IPv4-Mapped address.
			The field may be left blank if IPv6 operation on the interface is not
			desired.
		Mask Length	The IPv6 network mask, in number of bits (prefix length). Valid values
			are between 1 and 128 bits for an IPv6 address.
			The field may be left blank if IPv6 operation on the interface is not
			desired.
IP Routes	Delete		Select this option to delete an existing IP route.
	Network		The destination IP network or host address of this route. Valid format
			is dotted decimal notation or a valid IPv6 notation. A default route can
	Mask Length		use the value 0.0.0.0 or IPv6 :: notation.
			The destination IP network or host mask, in number of bits (prefix
			length). It defines how much of a network address that must match, in
			order to qualify for this route. Valid values are between 0 and 32 bits
			respectively 128 for IPv6 routes. Only a default route will have a mask
			length of 0 (as it will match anything).
	Gateway		The IP address of the IP gateway. Valid format is dotted decimal
			notation or a valid IPv6 notation. Gateway and Network must be of the
			same type.
	Next Hop	VLAN	The VLAN ID (VID) of the specific IPv6 interface associated with the
			gateway.
			The given VID ranges from 1 to 4095 and will be effective only when
			the corresponding IPv6 interface is valid.
			If the IPv6 gateway address is link-local, it must specify the next hop.

Buttons

Add Interface: Click to add a new IP interface. A maximum of 128 interfaces are supported.

Add Route: Click to add a new IP route. A maximum of 32 routes are supported.

Apply: Click to apply changes.

4.2.1.3 IP Status

IP Status displays the status of the IP protocol layer. The status is defined by the IP interfaces, the IP routes and the neighbor cache (ARP cache) status. The screen in Figure 4-2-1-3 appears.

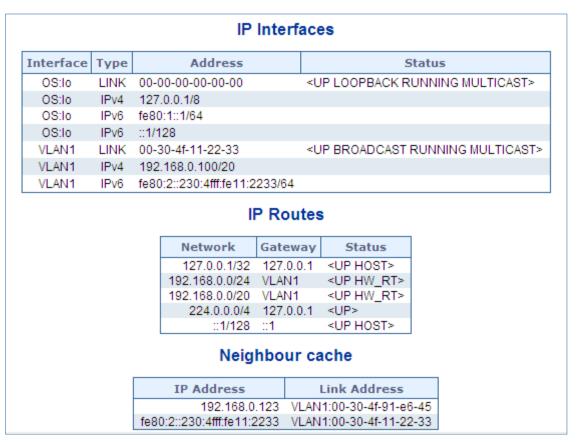

Figure 4-2-1-3: IP Status Page Screenshot

The page includes the following fields:

Object		Description	
IP Interfaces	Interface	The name of the interface.	
	Туре	The address type of the entry. This may be LINK or IPv4.	
	Address	The current address of the interface (of the given type).	
Status		The status flags of the interface (and/or address).	
IP Routes	Network	The destination IP network or host address of this route.	
	Gateway	The gateway address of this route.	
	Status	The status flags of the route.	
Neighbor Cache		The IP address of the entry.	
	Link Address	The Link (MAC) address for which a binding to the IP address given	
	LIIIK Address	exists.	

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Click to refresh the page.

4.2.1.4 Users Configuration

This page provides an overview of the current users. Currently the only way to log in as another user on the web server is to close and reopen the browser. After setup is completed, press the "Apply" button to take effect. Please login web interface with new user name and password; the screen in Figure 4-2-1-4 appears.

Figure 4-2-1-4: Users Configuration Page Screenshot

The page includes the following fields:

Object	Description
User Name	The name identifying the user. This is also a link to Add/Edit User.
Privilege Level	The privilege level of the user.
	The allowed range is 0 to 15 . If the privilege level value is 15, it can access all groups,
	i.e. that is granted the full control of the device. But other values need to refer to each
	group privilege level. User's privilege should be the same or greater than the group
	privilege level to have the access to that group.
	By default setting, most groups privilege level 5 has the read-only access and
	privilege level 10 has the read-write access. And the system maintenance (software
	upload, factory defaults and etc.) needs user privilege level 15.
	Generally, the privilege level 15 can be used for an administrator account, privilege
	level 10 for a standard user account and privilege level 5 for a guest account.

Buttons

Add New User : Click to add a new user.

Add / Edit User

This page configures a user – add, edit or delete user.

Figure 4-2-1-5: Add / Edit User Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Username	A string identifying the user name that this entry should belong to. The allowed string
	length is 1 to 31. The valid user name is a combination of letters, numbers and
	underscores.
• Password	The password of the user. The allowed string length is 0 to 31.
Password (again)	Please enter the user's new password here again to confirm.
Privilege Level	The privilege level of the user.
	The allowed range is 0 to 15 . If the privilege level value is 15, it can access all groups,
	i.e. that is granted the fully control of the device. But others value need to refer to each
	group privilege level. User's privilege should be same or greater than the group
	privilege level to have the access of that group.
	By default setting, most groups privilege level 5 has the read-only access and privilege level 10 has the read-write access. And the system maintenance (software upload, factory defaults and etc.) needs user privilege level 15.
	Generally, the privilege level 15 can be used for an administrator account, privilege level 10 for a standard user account and privilege level 5 for a guest account.

Buttons

Apply: Click to apply changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

Cancel: Click to undo any changes made locally and return to the Users.

Delete User: Delete the current user. This button is not available for new configurations (Add new user).

Once the new user is added, the new user entry is shown on the Users Configuration page.

Figure 4-2-1-6: User Configuration Page Screenshot

If you forget the new password after changing the default password, please press the "**Reset**" button on the front panel of the Industrial Managed Switch for over 10 seconds and then release it. The current setting including VLAN will be lost and the Industrial Managed Switch will restore to the default mode.

4.2.1.5 Privilege Levels

This page provides an overview of the privilege levels. After setup is completed, please press the **"Apply"** button to take effect. Please log in web interface with new user name and password and the screen in Figure 4-2-1-7 appears.

Figure 4-2-1-7: Privilege Levels Configuration Page Screenshot

The page includes the following fields:

Object	Description
Group Name	The name identifying the privilege group. In most cases, a privilege level group
	consists of a single module (e.g. LACP, RSTP or QoS), but a few of them
	contain more than one. The following description defines these privilege level
	groups in details:
	■ System: Contact, Name, Location, Timezone, Log.
	■ Security: Authentication, System Access Management, Port (contains
	Dot1x port, MAC based and the MAC Address Limit), ACL, HTTPS, SSH,
	ARP Inspection and IP source guard.
	■ IP: Everything except 'ping'.
	■ Port: Everything except 'VeriPHY'.
	■ Diagnostics: 'ping' and 'VeriPHY'.
	■ Maintenance: CLI- System Reboot, System Restore Default, System
	Password, Configuration Save, Configuration Load and Firmware Load.
	Web- Users, Privilege Levels and everything in Maintenance.
	■ Debug : Only present in CLI.
Privilege Level	Every privilege level group has an authorization level for the following sub
	groups:
	■ Configuration read-only
	■ Configuration/execute read-write
	■ Status/statistics read-only
	■ Status/statistics read-write (e.g. for clearing of statistics).
	User Privilege should be same or greater than the authorization Privilege level to
	have the access to that group.

Buttons

Apply: Click to apply changes.

4.2.1.6 NTP Configuration

Configure NTP on this page. **NTP** is an acronym for **Network Time Protocol**, a network protocol for synchronizing the clocks of computer systems. NTP uses UDP (data grams) as transport layer. You can specify NTP Servers. The NTP Configuration screen in Figure 4-2-1-8 appears.

Figure 4-2-1-8: NTP Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Mode	Indicates the NTP mode operation. Possible modes are:
	■ Enabled: Enable NTP mode operation. When enabling NTP mode
	operation, the agent forward and transfer NTP messages between the
	clients and the server when they are not on the same subnet domain.
	■ Disabled : Disable NTP mode operation.
• Server #	Provide the NTP IPv4 or IPv6 address of this switch. IPv6 address is in 128-bit
	records represented as eight fields of up to four hexadecimal digits with a colon
	separating each field (:).
	For example, 'fe80::215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16-bit groups of
	contiguous zeros, but it can only appear once. It also uses a legal IPv4 address
	like '::192.1.2.34'.

Buttons

Apply: Click to apply changes.

4.2.1.6.1 System Time Correction Manually

Configure NTP on this page. **NTP** is an acronym for **Network Time Protocol**, a network protocol for synchronizing the clocks of computer systems. NTP uses UDP (data grams) as transport layer. You can specify NTP Servers. The NTP Configuration screen in Figure 4-2-1-9 appears.

System Time Correction Manually User Manually Enable Year 1970 $(1970 \sim 2037)$ Month 1 $(1 \sim 12)$ Day $(1 \sim 31)$ 0 Hour $(0 \sim 23)$ Minute 0 $(0 \sim 59)$ 0 Second $(0 \sim 59)$ Apply Reset

Figure 4-2-1-9: System Time Correction Manually Page Screenshot

The page includes the following fields:

Object	Description
User Manually	Indicates the NTP mode as manual operation. Possible modes are:
	■ Enabled: Enable NTP manual mode operation. When enabling NTP user
	manually mode operation, the system time will follow the date setting.
	■ Disabled : Disable NTP user manual mode operation.
• Date	Switch can set the Year/Mouth/Day/Hour/Minute/Second on this page

Buttons

Apply: Click to apply changes.

4.2.1.7 Time Configuration

Configure Time Zone on this page. A **Time Zone** is a region that has a uniform standard time for legal, commercial, and social purposes. It is convenient for areas in close commercial or other communication to keep the same time, so time zones tend to follow the boundaries of countries and their subdivisions. The Time Zone Configuration screen in Figure 4-2-1-10 appears

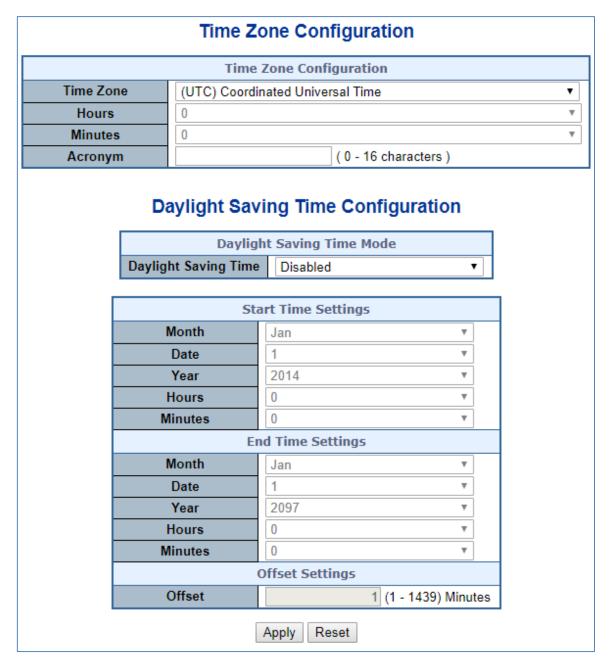

Figure 4-2-1-10: Time Configuration Page Screenshot

The page includes the following fields:

Object	Description
Time Zone	Lists various Time Zones worldwide. Select appropriate Time Zone from the
	drop-down and click Save to set.
• Acronym	User can set the acronym of the time zone. This is a User configurable acronym
	to identify the time zone. (Range: Up to 16 characters)
Daylight Saving Time	This is used to set the clock forward or backward according to the configurations
	set below for a defined Daylight Saving Time duration. Select 'Disable' to disable
	the Daylight Saving Time configuration. Select 'Recurring' and configure the
	Daylight Saving Time duration to repeat the configuration every year. Select
	'Non-Recurring' and configure the Daylight Saving Time duration for single time
	configuration. (Default: Disabled).
• Start Time Settings	Week - Select the starting week number.
	Day - Select the starting day.
	Month - Select the starting month.
	Hours - Select the starting hour.
	Minutes - Select the starting minute.
 End Time Settings 	Week - Select the ending week number.
	Day - Select the ending day.
	Month - Select the ending month.
	Hours - Select the ending hour.
	Minutes - Select the ending minute
 Offset Settings 	Enter the number of minutes to add during Daylight Saving Time. (Range: 1 to
	1440)

Buttons

Apply: Click to apply changes.

4.2.1.8 UPnP

Configure UPnP on this page. UPnP is an acronym for **Universal Plug and Play**. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components. The UPnP Configuration screen in Figure 4-2-1-11 appears.

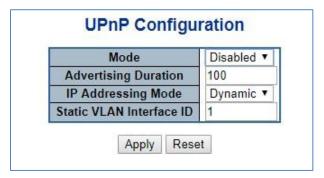

Figure 4-2-1-11: UPnP Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Mode	Indicates the UPnP operation mode. Possible modes are:
	■ Enabled: Enable UPnP mode operation.
	■ Disabled : Disable UPnP mode operation.
	When the mode is enabled, two ACEs are added automatically to trap UPnP related
	packets to CPU. The ACEs are automatically removed when the mode is disabled.
 Advertising 	The duration, carried in SSDP packets, is used to inform a control point or control
Duration	points how often it or they should receive a SSDP advertisement message from this
	switch. If a control point does not receive any message within the duration, it will think
	that the switch no longer exists. Due to the unreliable nature of UDP, in the standard it
	is recommended that such refreshing of advertisements to be done at less than one-
	half of the advertising duration. In the implementation, the switch sends SSDP
	messages periodically at the interval one-half of the advertising duration minus 30
	seconds. Valid values are in the range 100 to 86400.
IP Addressing	IP addressing mode provides two ways to determine IP address assignment:
Mode	Dynamic: Default selection for UPnP. UPnP module helps users choosing the IP
	address of the switch device. It finds the first available system IP address.
	Static: User specifies the IP interface VLAN for choosing the IP address of the
	switch device.
Static VLAN	The index of the specific IP VLAN interface. It will only be applied when IP Addressing
Interface ID	Mode is static. Valid configurable values ranges from 1 to 4095. Default value is 1.

Buttons

Apply: Click to apply changes

4.2.1.9 DHCP Relay

Configure DHCP Relay on this page. **DHCP Relay** is used to forward and transfer DHCP messages between the clients and the server when they are not on the same subnet domain.

The **DHCP option 82** enables a DHCP relay agent to insert specific information into a DHCP request packets when forwarding client DHCP packets to a DHCP server and remove the specific information from a DHCP reply packets when forwarding server DHCP packets to a DHCP client. The DHCP server can use this information to implement IP address or other assignment policies. Specifically the option works by setting two sub-options:

- Circuit ID (option 1)
- Remote ID (option 2)

The Circuit ID sub-option is supposed to include information specific to which circuit the request came in on.

The Remote ID sub-option was designed to carry information relating to the remote host end of the circuit.

The definition of Circuit ID in the switch is 4 bytes in length and the format is "vlan_id" "module_id" "port_no". The parameter of "vlan_id" is the first two bytes representing the VLAN ID. The parameter of "module_id" is the third byte for the module ID. The parameter of "port_no" is the fourth byte and it means the port number.

The Remote ID is 6 bytes in length, and the value equals the DHCP relay agent's MAC address. The DHCP Relay Configuration screen in Figure 4-2-1-12 appears.

Figure 4-2-1-12 DHCP Relay Configuration Page Screenshot

The page includes the following fields:

Object	Description
Relay Mode	Indicates the DHCP relay mode operation. Possible modes are:
	■ Enabled: Enable DHCP relay mode operation. When enabling DHCP relay
	mode operation, the agent forwards and transfers DHCP messages
	between the clients and the server when they are not on the same subnet
	domain. And the DHCP broadcast message won't flood for security
	considered.
	■ Disabled : Disable DHCP relay mode operation.
Relay Server	Indicates the DHCP relay server IP address. A DHCP relay agent is used to
	forward and transfer DHCP messages between the clients and the server when

	they are not on the same subnet domain.
Relay Information	Indicates the DHCP relay information mode option operation. Possible modes
Mode	are:
	■ Enabled: Enable DHCP relay information mode operation. When enabling
	DHCP relay information mode operation, the agent inserts specific
	information (option82) into a DHCP message when forwarding to DHCP
	server and removing it from a DHCP message when transferring to DHCP
	client. It only works under DHCP relay operation mode enabled.
	■ Disabled : Disable DHCP relay information mode operation.
Relay Information	Indicates the DHCP relay information option policy. When enabling DHCP relay
Policy	information mode operation, if agent receives a DHCP message that already
	contains relay agent information. It will enforce the policy. And it only works
	under DHCP relay information operation mode enabled. Possible policies are:
	■ Replace: Replace the original relay information when receiving a DHCP
	message that already contains it.
	■ Keep : Keep the original relay information when receiving a DHCP message
	that already contains it.
	■ Drop : Drop the package when receiving a DHCP message that already
	contains relay information.

Buttons

Apply: Click to apply changes

4.2.1.10 DHCP Relay Statistics

This page provides statistics for DHCP relay. The DHCP Relay Statistics screen in Figure 4-2-1-13 appears.

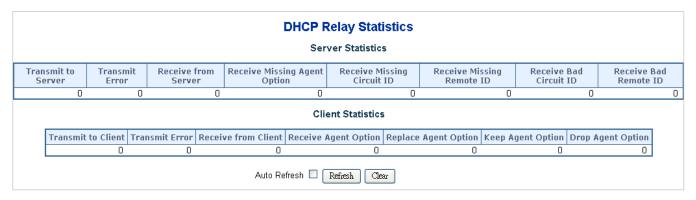

Figure 4-2-1-13: DHCP Relay Statistics Page Screenshot

The page includes the following fields:

Server Statistics

Object	Description
Transmit to Server	The packets number that relayed from client to server.
Transmit Error	The packets number that erroneously sent packets to clients.
Receive from Server	The packets number that received packets from server.
Receive Missing Agent Option	The packets number that received packets without agent information options.
Receive Missing Circuit ID	The packets number that received packets whose the Circuit ID option was missing.
Receive Missing Remote ID	The packets number that received packets whose Remote ID option was missing.
Receive Bad Circuit ID	The packets number whose the Circuit ID option did not match known circuit ID.
Receive Bad Remote ID	The packets number whose the Remote ID option did not match known Remote ID.

Client Statistics

Object	Description
Transmit to Client	The packets number that relayed packets from server to client.
Transmit Error	The packets number that erroneously sent packets to servers.
Receive from Client	The packets number that received packets from server.
Receive Agent Option	The packets number that received packets with relay agent information option.
Replace Agent Option	The packets number that replaced received packets with relay agent information option.
Keep Agent Option	The packets number that kept received packets with relay agent information option.
Drop Agent Option	The packets number that dropped received packets with relay agent information option.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

Clear : Clears all statistics.

4.2.1.11 CPU Load

This page displays the CPU load, using an SVG graph. The load is measured as average over the last 100ms, 1 sec and 10 seconds intervals. The last 120 samples are graphed, and the last numbers are displayed as text as well. In order to display the SVG graph, your browser must support the SVG format. Consult the SVG Wiki for more information on browser support. Specifically, at the time of writing, Microsoft Internet Explorer will need to have a plugin installed to support SVG. The CPU Load screen in Figure 4-2-1-14 appears.

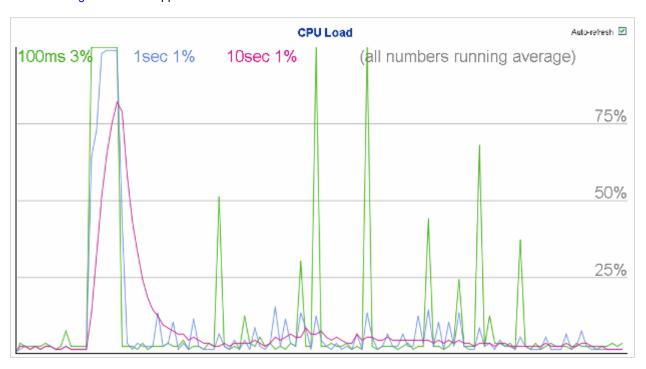

Figure 4-2-1-14: CPU Load Page Screenshot

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

If your browser cannot display anything on this page, please download Adobe SVG tool and install it in your computer.

4.2.1.12 System Log

The Industrial Managed Switch system log information is provided here. The System Log screen in Figure 4-2-1-15 appears.

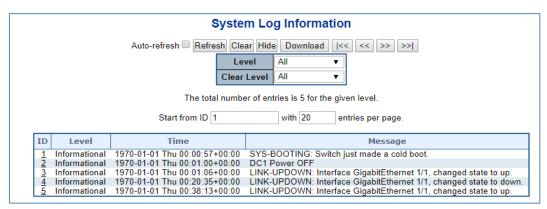

Figure 4-2-1-15: System Log Page Screenshot

The page includes the following fields:

Object	Description
• ID	The ID (>= 1) of the system log entry.
• Level	The level of the system log entry. The following level types are supported:
	■ Info: Information level of the system log.
	■ Warning: Warning level of the system log.
	■ Error: Error level of the system log.
	■ All: All levels.
Clear Level	To clear the system log entry level. The following level types are supported:
	■ Info: Information level of the system log.
	■ Warning: Warning level of the system log.
	■ Error: Error level of the system log.
	■ All: All levels.
• Time	The time of the system log entry.
• Message	The message of the system log entry.

Buttons

Auto-refresh .: Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds. Refresh Updates the system log entries, starting from the current entry ID. Clear : Flushes the selected log entries. Hide Hides the selected log entries. Download Downloads the selected log entries. k< Updates the system log entries, starting from the first available entry ID. << Updates the system log entries, ending at the last entry currently displayed. >> Updates the system log entries, starting from the last entry currently displayed. \gg Updates the system log entries, ending at the last available entry ID.

4.2.1.13 Detailed Log

The **Industrial Managed Switch** system detailed log information is provided here. The Detailed Log screen in Figure 4-2-1-16 appears.

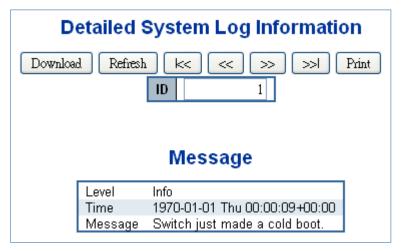

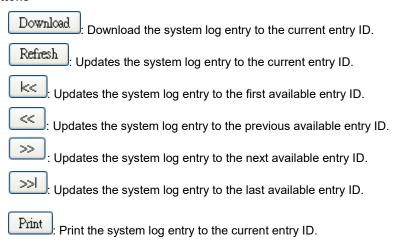

Figure 4-2-1-16: Detailed Log Page Screenshot

The page includes the following fields:

Object	Description
• ID	The ID (>= 1) of the system log entry.
Message	The message of the system log entry.

Buttons

4.2.1.14 Remote Syslog

Configure remote syslog on this page. The Remote Syslog screen in Figure 4-2-1-17 appears.

Figure 4-2-1-17: Remote Syslog Page Screenshot

The page includes the following fields:

Object	Description
• Mode	Indicates the server mode operation. When the mode operation is enabled, the
	syslog message will send out to syslog server. The syslog protocol is based on
	UDP communication and received on UDP port 514 and the syslog server will
	not send acknowledgments back sender since UDP is a connectionless protocol
	and it does not provide acknowledgments. The syslog packet will always send
	out even if the syslog server does not exist. Possible modes are:
	■ Enabled: Enable remote syslog mode operation.
	■ Disabled : Disable remote syslog mode operation.
Syslog Server IP	Indicates the IPv4 host address of syslog server. If the switch provides DNS
	feature, it also can be a host name.
Syslog Level	Indicates what kind of message will send to syslog server. Possible modes are:
	■ Info: Send information, warnings and errors.
	■ Warning: Send warnings and errors.
	■ Error: Send errors.

Buttons

Apply: Click to apply changes

4.2.1.15 SMTP Configuration

This page facilitates an SMTP Configuration on the switch. The SMTP Configure screen in Figure 4-2-1-18 appears.

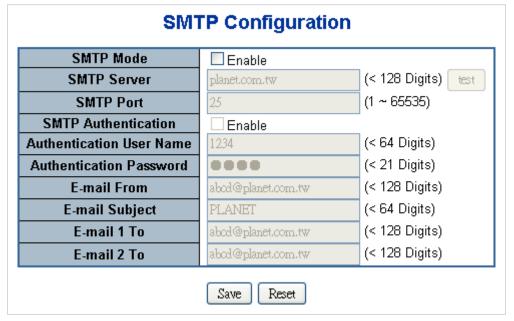

Figure 4-2-1-18: SMTP Configuration Page Screenshot

The page includes the following fields:

Object	Description
SMTP Mode	Controls whether SMTP is enabled on this switch.
SMTP Server	Type the SMTP server name or the IP address of the SMTP server.
SMTP Port	Set port number of SMTP service.
SMTP Authentication	Controls whether SMTP authentication is enabled if authentication is required
	when an e-mail is sent.
Authentication User	Type the user name for the SMTP server if Authentication is Enabled.
Name	
 Authentication 	Type the password for the SMTP server if Authentication is Enabled.
Password	
• E-mail From	Type the sender's e-mail address. This address is used for reply e-mails.
E-mail Subject	Type the subject/title of the e-mail.
• E-mail 1 To	Type the receiver's e-mail address.
• E-mail 2 To	

Buttons

Save: Click to save changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.1.16 Fault Alarm

This page facilitates an update of the firmware controlling the switch. The Web Firmware Upgrade screen in Figure 4-2-1-19 appears.

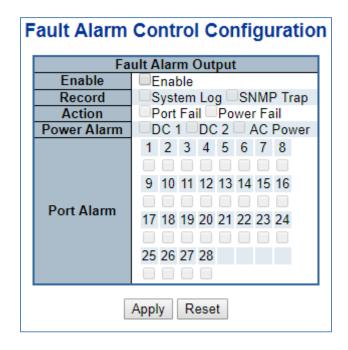

Figure 4-2-1-19: Fault Alarm Control Configuration page Screenshot

The page includes the following fields:

Object	Description
• Enable	Controls whether Fault Alarm is enabled on this switch.
• Record	Controls whether Record is sending System log or SNMP Trap or both.
• Action	Controls whether Port Fail or Power Fail or both for fault detecting.
Power Alarm	Controls whether AC, DC1 or DC2 or both for fault detecting.
Port Alarm	Controls which Ports or all for fault detecting.

Buttons

Apply: Click to apply changes

4.2.1.17 Digital Input/Output

Digital Input allows user to log external device (such as industrial cooler) dead or alive or something else. System will log a user customized message into system log and syslog, and issue SNMP trap or issue an alarm E-mail.

Digital Output allows user to monitor the switch port and power, and let system issue a high or low signal to an external device (such as alarm) when the monitor port or power has failed. The Configuration screen in Figure 4-2-1-20 appears.

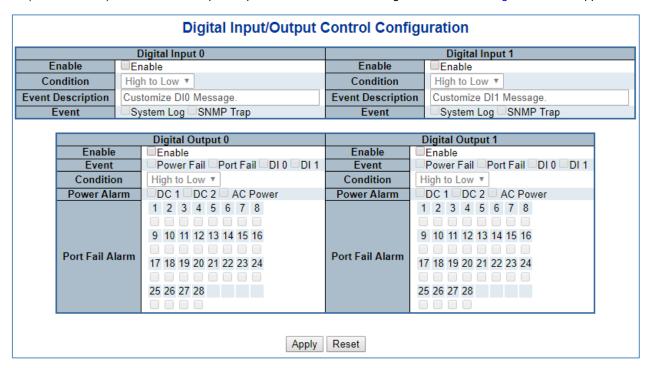

Figure 4-2-1-20 Digital Input/Output Control Configuration page Screenshot

The page includes the following fields:

Object	Description	
• Enable	Check the Enable checkbox to enable Digital Input / Output function.	
	Uncheck the Enable checkbox to disable Digital Input / Output function.	
• Condition	As Digital Input:	
	Allows user to select High to Low or Low to High. This means a signal received by	
	system is from High to Low or From Low to High. It will trigger an action that logs a	
	customize message or issue the message from the switch.	
	As Digital Output:	
	Allows user to select High to Low or Low to High. This means that when the	
	switch is power-failed or port-failed, then system will issue a High or Low	
	signal to an external device such as an alarm.	
• Event Description	Allows user to set a customized message for Digital Input function alarming.	
• Event	As Digital Input:	
	Allows user to record alarm message to System log, syslog or issues out via SNMP	
	Trap or SMTP.	
	As default SNMP Trap and SMTP are disabled, please enable them first if you want	
	to issue alarm message via them.	

	As Digital Output:
	Allows user to monitor an alarm from port failure, power failure, Digital Input 0 (DI 0)
	and Digital Input 1(DI 1) which means if Digital Output has detected these events,
	then Digital Output would be triggered according to the setting of Condition.
Power Alarm	Allows user to choose which power module that needs to be monitored.
Port Alarm	Allows user to choose which port that needs to be monitored.

Buttons

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.1.18 ARP

This page provides ARP configuration settings. press the "Apply" button to take effect, the screen in Figure 4-2-1-21 appears.

ARP Table Configuration

Aging Configuration

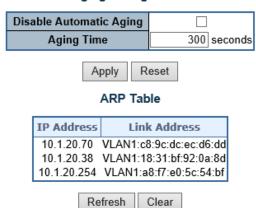

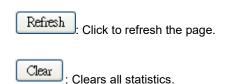

Figure 4-2-1-21: ARP Table Configuration Page Screenshot

The page includes the following fields:

Object		Description
• Aging	Disable Automatic Aging	Allow to click to disable the automatic aging.
Configuration	Anima Tima	Allow to change the aging time settings and the available range is 10
	Aning Time	to 1000000 seconds.
ARP Table	IP Address	Display the IP address.
	Link Address	Display the VLAN and MAC address information.

Buttons

4.2.2 Simple Network Management Protocol

4.2.2.1 SNMP Overview

The Simple Network Management Protocol (SNMP) is an application layer protocol that facilitates the exchange of management information between network devices. It is part of the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol suite. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

An SNMP-managed network consists of three key components: Network management stations (NMSs), SNMP agents, Management information base (MIB) and network-management protocol:

- Network management stations (NMSs): Sometimes called consoles, these devices execute management applications that monitor and control network elements. Physically, NMSs are usually engineering workstation-caliber computers with fast CPUs, megapixel color displays, substantial memory, and abundant disk space. At least one NMS must be present in each managed environment.
- Agents: Agents are software modules that reside in network elements. They collect and store management information such as the number of error packets received by a network element.
- Management information base (MIB): A MIB is a collection of managed objects residing in a virtual information store.
 Collections of related managed objects are defined in specific MIB modules.
- Network-management protocol: A management protocol is used to convey management information between agents and NMSs. SNMP is the Internet community's de facto standard management protocol.

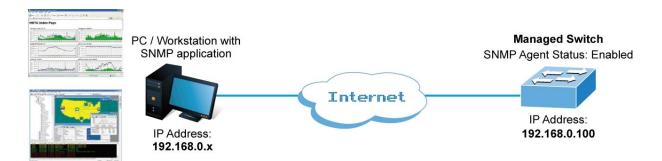

Figure 4-2-2-1:

SNMP Operations

SNMP itself is a simple request/response protocol. NMSs can send multiple requests without receiving a response.

- Get -- Allows the NMS to retrieve an object instance from the agent.
- **Set** -- Allows the NMS to set values for object instances within an agent.
- **Trap --** Used by the agent to asynchronously inform the NMS of some event. The SNMPv2 trap message is designed to replace the SNMPv1 trap message.

SNMP community

An SNMP community is the group that devices and management stations running SNMP belong to. It helps define where information is sent. The community name is used to identify the group. An SNMP device or agent may belong to more than one SNMP community. It will not respond to requests from management stations that do not belong to one of its communities. SNMP default communities are:

- Write = private
- Read = public

Use the SNMP Menu to display or configure the **Industrial Managed Switch** 's SNMP function. This section has the following items:

System Configuration	Configure SNMP on this page.
Trap Configuration	Configure SNMP trap on this page.
System Information	The system information is provided here.
SNMPv3 Communities	Configure SNMPv3 communities table on this page.
SNMPv3 Users	Configure SNMPv3 users table on this page.
SNMPv3 Groups	Configure SNMPv3 groups table on this page.
SNMPv3 Views	Configure SNMPv3 views table on this page.
SNMPv3 Access	Configure SNMPv3 accesses table on this page.

4.2.2.2 SNMP System Configuration

Configure SNMP on this page. The <u>SNMP</u> System Configuration screen in Figure 4-2-2-2 appears.

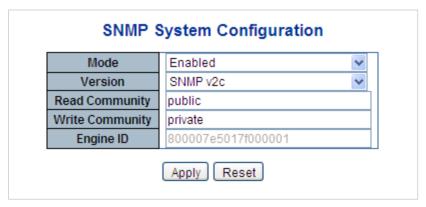

Figure 4-2-2: SNMP System Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Mode	Indicates the SNMP mode operation. Possible modes are:
	■ Enabled: Enable SNMP mode operation.
	■ Disabled : Disable SNMP mode operation.
• Version	Indicates the SNMP supported version. Possible versions are:
	■ SNMP v1: Set SNMP supported version 1.
	■ SNMP v2c: Set SNMP supported version 2c.
	■ SNMP v3: Set SNMP supported version 3.
Read Community	Indicates the community read access string to permit access to SNMP agent.
	The allowed string length is 0 to 255, and the allowed content is the ASCII
	characters from 33 to 126.
	The field is applicable only when SNMP version is SNMPv1 or SNMPv2c. If
	SNMP version is SNMPv3, the community string will be associated with
	SNMPv3 communities table. It provides more flexibility to configure security
	name than a SNMPv1 or SNMPv2c community string. In addition to community
	string, a particular range of source addresses can be used to restrict source
	subnet.
Write Community	Indicates the community write access string to permit access to SNMP agent.
,	The allowed string length is 0 to 255, and the allowed content is the ASCII
	characters from 33 to 126.
	The field is applicable only when SNMP version is SNMPv1 or SNMPv2c. If
	SNMP version is SNMPv3, the community string will be associated with
	SNMPv3 communities table. It provides more flexibility to configure security
	name than a SNMPv1 or SNMPv2c community string. In addition to community
	string, a particular range of source addresses can be used to restrict source
	subnet.
Engine ID	Indicates the SNMPv3 engine ID. The string must contain an even number
	between 10 and 64 hexadecimal digits, but all-zeros and all-'F's are not allowed.
	Change of the Engine ID will clear all original local users.

Buttons

Apply: Click to apply changes

4.2.2.3 SNMP Trap Configuration

4.2.2.3.1 Destinations

Configure SNMP trap on this page. The SNMP Trap Configuration screen in Figure 4-2-2-3 appears.

SNMP Trap Configuration

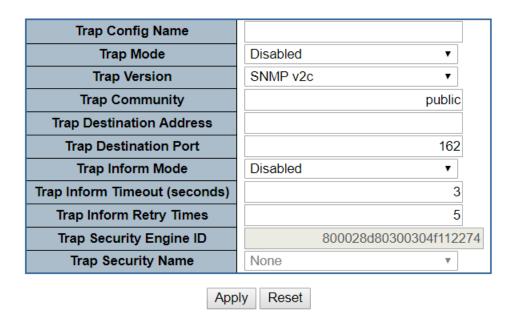

Figure 4-2-2-3: SNMP Trap Configuration Page Screenshot

The page includes the following fields:

Object	Description	
Trap Config	Indicates which trap Configuration's name for configuring. The allowed string	
	length is 0 to 255, and the allowed content is ASCII characters from 33 to 126.	
Trap Mode	Indicates the SNMP trap mode operation. Possible modes are:	
	■ Enabled: Enable SNMP trap mode operation.	
	■ Disabled : Disable SNMP trap mode operation.	
Trap Version	Indicates the SNMP trap supported version. Possible versions are:	
	■ SNMP v1: Set SNMP trap supported version 1.	
	■ SNMP v2c: Set SNMP trap supported version 2c.	
	■ SNMP v3: Set SNMP trap supported version 3.	
Trap Community	Indicates the community access string when send SNMP trap packet. The	
	allowed string length is 0 to 255, and the allowed content is the ASCII characters	
	from 33 to 126.	
Trap Destination	Indicates the SNMP trap destination address.	
Address		
Trap Destination Port	Indicates the SNMP trap destination port. SNMP Agent will send SNMP	
	message via this port, the port range is 1~65535.	

Trap Inform Mode	Indicates the SNMP trap inform mode operation. Possible modes are:
	■ Enabled: Enable SNMP trap authentication failure.
	■ Disabled : Disable SNMP trap authentication failure.
Trap Inform Timeout	Indicates the SNMP trap inform timeout.
(seconds)	The allowed range is 0 to 2147.
Trap Inform Retry	Indicates the SNMP trap inform retry times.
Times	The allowed range is 0 to 255.
Trap Probe Security	Indicates the SNMPv3 trap probe security engine ID mode of operation.
Engine ID	Possible values are:
	■ Enabled: Enable SNMP trap probe security engine ID mode of operation.
	■ Disabled : Disable SNMP trap probe security engine ID mode of operation.
Trap Security Engine	Indicates the SNMP trap security engine ID. SNMPv3 sends traps and informs
ID	using USM for authentication and privacy. A unique engine ID for these traps
	and informs is needed. When "Trap Probe Security Engine ID" is enabled, the ID
	will be probed automatically. Otherwise, the ID specified in this field is used. The
	string must contain an even number(in hexadecimal format) with number of
	digits between 10 and 64, but all-zeros and all-'F's are not allowed.
Trap Security Name	Indicates the SNMP trap security name. SNMPv3 traps and informs using USM
	for authentication and privacy. A unique security name is needed when traps and
	informs are enabled.
• System	Enable/disable that the Interface group's traps. Possible traps are:
	■ Warm Start: Enable/disable Warm Start trap.
	■ Cold Start: Enable/disable Cold Start trap.
• Interface	Indicates that the Interface group's traps. Possible traps are:
	■ Link Up: Enable/disable Link up trap.
	■ Link Down: Enable/disable Link down trap.
	■ LLDP: Enable/disable LLDP trap.
• AAA	Indicates that the AAA group's traps. Possible traps are:
	Authentication Fail: Enable/disable SNMP trap authentication failure
	trap.
• Switch	Indicates that the Switch group's traps. Possible traps are:
	■ STP: Enable/disable STP trap.
	■ RMON: Enable/disable RMON trap.

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.2.3.2 Sources

This page provides SNMP trap source configurations. A trap is sent for the given trap source if at least one filter with filter type included matches the filter, and no filters with filter type excluded matches.

Figure 4-2-2-4: SNMP Trap Source Configuration Page Screenshot

Click "Add New Entry" to add a new entry. The maximum entry count is 32.

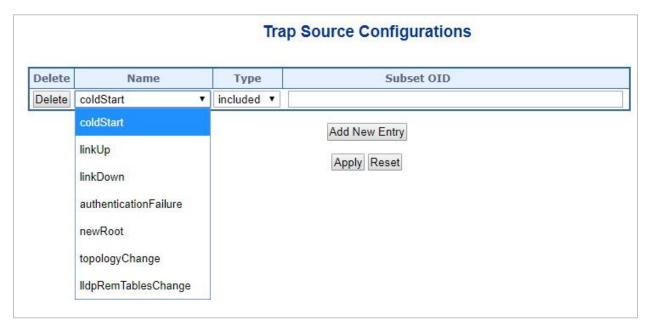

Figure 4-2-2-5: SNMP Trap Source Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Name	Indicates the name for the entry.
• Type	The filter type for the entry. Possible types are:
	■ included: An optional flag to indicate a trap is sent for the given trap source
	is matched.
	excluded: An optional flag to indicate a trap is not sent for the given trap
	source is matched.
Subset OID	The subset OID for the entry.
	The value should depend on the what kind of trap name.
	For example, the ifldex is the subset OID of linkUp and linkDown. A valid subset
	OID is one or more digital number(0-4294967295) or asterisk(*) which are
	separated by dots(.). The first character must not begin with asterisk(*) and the
	maximum of OID count must not exceed 128.

Buttons

Add New Entry: Click to add a new community entry. The maximum entry count is 32

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.2.4 SNMP System Information

The switch system information is provided here. The SNMP System Information screen in Figure 4-2-2-6 appears.

Figure 4-2-2-6: System Information Configuration Page Screenshot

The page includes the following fields:

Object	Description
System Contact	The textual identification of the contact person for this managed node, together
	with information on how to contact this person. The allowed string length is 0 to
	255, and the allowed content is the ASCII characters from 32 to 126.
System Name	An administratively assigned name for this managed node. By convention, this is
	the node's fully-qualified domain name. A domain name is a text string drawn
	from the alphabet (A-Za-z), digits (0-9), minus sign (-). No space characters are
	permitted as part of a name. The first character must be an alpha character. And
	the first or last character must not be a minus sign. The allowed string length is 0
	to 255.
System Location	The physical location of this node(e.g., telephone closet, 3rd floor). The allowed
	string length is 0 to 255, and the allowed content is the ASCII characters from 32
	to 126.

4.2.2.5 SNMPv3 Communities

Configure SNMPv3 communities table on this page. The entry index key is Community. The <u>SNMP</u>v3 Communities screen in Figure 4-2-2-7 appears.

Figure 4-2-2-7: SNMPv3 Communities Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
Community Name	Indicates the community access string to permit access to SNMPv3 agent. The
	allowed string length is 1 to 32, and the allowed content is ASCII characters from
	33 to 126. The community string will be treated as security name and map a
	SNMPv1 or SNMPv2c community string.
Community Secret	Indicates the community secret (access string) to permit access using SNMPv1
	and SNMPv2c to the SNMP agent. The allowed string length is 1 to 32, and the
	allowed content is ASCII characters from 33 to 126.
Source IP	Indicates the SNMP access source address. A particular range of source
	addresses can be used to restrict source subnet when combined with source
	mask.
Source Mask	Indicates the SNMP access source address mask.

Buttons

Add New Entry: Click to add a new community entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.2.6 SNMPv3 Users

Configure SNMPv3 users table on this page. The entry index keys are Engine ID and User Name. The <u>SNMP</u>v3 Users screen in Figure 4-2-2-8 appears.

Figure 4-2-2-8: SNMPv3 Users Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
Engine ID	An octet string identifying the engine ID that this entry should belong to. The
	string must contain an even number(in hexadecimal format) with number of
	digits between 10 and 64, but all-zeros and all-'F's are not allowed. The
	SNMPv3 architecture uses the User-based Security Model (USM) for message
	security and the View-based Access Control Model (VACM) for access control.
	For the USM entry, the usmUserEngineID and usmUserName are the entry's
	keys.
	In a simple agent, usmUserEngineID is always that agent's own snmpEngineID
	value. The value can also take the value of the snmpEngineID of a remote
	SNMP engine with which this user can communicate. In other words, if user
	engine ID equal system engine ID then it is local user; otherwise it's remote
	user.
• User Name	A string identifying the user name that this entry should belong to. The allowed
	string length is 1 to 32, and the allowed content is ASCII characters from 33 to
	126.
Security Level	Indicates the security model that this entry should belong to. Possible security
	models are:
	■ NoAuth, NoPriv: None authentication and none privacy.
	■ Auth, NoPriv: Authentication and none privacy.
	■ Auth, Priv: Authentication and privacy.
	The value of security level cannot be modified if entry already exist. That means
	must first ensure that the value is set correctly.

Authentication	Indicates the authentication protocol that this entry should belong to. Possible
Protocol	authentication protocol are:
	None: None authentication protocol.
	■ MD5: An optional flag to indicate that this user using MD5 authentication
	protocol.
	■ SHA: An optional flag to indicate that this user using SHA authentication
	protocol.
	The value of security level cannot be modified if entry already exist. That means
	must first ensure that the value is set correctly.
 Authentication 	A string identifying the authentication pass phrase. For MD5 authentication
Password	protocol, the allowed string length is 8 to 32. For SHA authentication protocol,
	the allowed string length is 8 to 40. The allowed content is the ASCII characters
	from 33 to 126.
 Privacy Protocol 	Indicates the privacy protocol that this entry should belong to. Possible privacy
	protocol are:
	None: None privacy protocol.
	■ DES : An optional flag to indicate that this user using DES authentication
	protocol.
	■ AES : An optional flag to indicate that this user uses AES authentication
	protocol.
Privacy Password	A string identifying the privacy pass phrase. The allowed string length is 8 to 32,
	and the allowed content is the ASCII characters from 33 to 126.

Buttons

Add New Entry : Click to add a new user entry.

Apply : Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.2.7 SNMPv3 Groups

Configure SNMPv3 groups table on this page. The entry index keys are Security Model and Security Name. The SNMPv3 Groups screen in Figure 4-2-2-9 appears.

	SNMPv3 Group Configuration		
Delete	Security Model	Security Name	Group Name
	v1	public	default_ro_group
	v1	private	default_rw_group
	v2c	public	default_ro_group
	v2c	private	default_rw_group
		Add New Entry	Apply Reset

Figure 4-2-9: SNMPv3 Groups Configuration Page Screenshot

The page includes the following fields:

Object	Description	
• Delete	Check to delete the entry. It will be deleted during the next save.	
Security Model	Indicates the security model that this entry should belong to. Possible security models are:	
	■ v1: Reserved for SNMPv1.	
	■ v2c: Reserved for SNMPv2c.	
	■ usm: User-based Security Model (USM).	
Security Name	A string identifying the security name that this entry should belong to.	
	The allowed string length is 1 to 32, and the allowed content is the ASCII	
	characters from 33 to 126.	
Group Name	A string identifying the group name that this entry should belong to.	
	The allowed string length is 1 to 32, and the allowed content is the ASCII	
	characters from 33 to 126.	

Buttons

Add New Entry : Click to add a new group entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.2.8 SNMPv3 Views

Configure SNMPv3 views table on this page. The entry index keys are View Name and OID Subtree. The <u>SNMP</u>v3 Views screen in Figure 4-2-2-10 appears.

Figure 4-2-2-10: SNMPv3 Views Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
View Name	A string identifying the view name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.
View Type	Indicates the view type that this entry should belong to. Possible view type are: included: An optional flag to indicate that this view subtree should be included. excluded: An optional flag to indicate that this view subtree should be excluded. In general, if a view entry's view type is 'excluded', it should be exist another view entry which view type is 'included' and it's OID subtree overstep the 'excluded' view entry.
OID Subtree	The OID defining the root of the subtree to add to the named view. The allowed OID length is 1 to 128. The allowed string content is digital number or asterisk(*).

Buttons

Add New Entry
: Click to add a new view entry.

Apply
: Click to apply changes

Reset
: Click to undo any changes made locally and revert to previously saved values.

4.2.2.9 SNMPv3 Access

Configure SNMPv3 accesses table on this page. The entry index keys are Group Name, Security Model and Security Level. The <u>SNMP</u>v3 Access screen in Figure 4-2-2-11 appears.

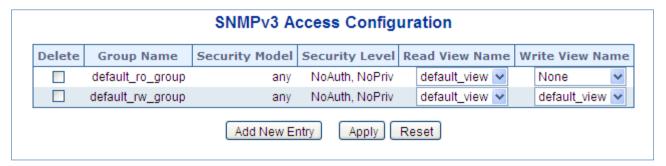

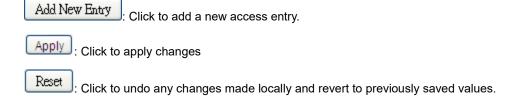

Figure 4-2-2-11: SNMPv3 Accesses Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
Group Name	A string identifying the group name that this entry should belong to. The allowed string
	length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.
Security Model	Indicates the security model that this entry should belong to. Possible security models are:
	■ any: Accepted any security model (v1 v2c usm).
	■ v1: Reserved for SNMPv1.
	■ v2c: Reserved for SNMPv2c.
	■ usm: User-based Security Model (USM)
Security Level	Indicates the security model that this entry should belong to. Possible security models are:
	■ NoAuth, NoPriv: None authentication and none privacy.
	■ Auth, NoPriv: Authentication and none privacy.
	■ Auth, Priv: Authentication and privacy.
Read View Name	The name of the MIB view defining the MIB objects for which this request may request the
	current values. The allowed string length is 1 to 32, and the allowed content is the ASCII
	characters from 33 to 126.
Write View Name	The name of the MIB view defining the MIB objects for which this request may potentially
	SET new values. The allowed string length is 1 to 32, and the allowed content is the ASCII
	characters from 33 to 126.

Buttons

4.2.3 RMON

RMON is the most important expansion of the standard SNMP. RMON is a set of MIB definitions, used to define standard network monitor functions and interfaces, enabling the communication between SNMP management terminals and remote monitors. RMON provides a highly efficient method to monitor actions inside the subnets.

MID of RMON consists of 10 groups. The switch supports the most frequently used groups 1, 2, 3 and 9:

- Statistics: Maintain basic usage and error statistics for each subnet monitored by the agent.
- **History:** Record periodical statistic samples available from statistics.
- Alarm: Allow management console users to set any count or integer for sample intervals and alert thresholds for RMON agent records.
- Event: A list of all events generated by RMON agent.

Alarm depends on the implementation of Event. Statistics and History display some current or history subnet statistics. Alarm and Event provide a method to monitor any integer data change in the network, and provide some alerts upon abnormal events (sending Trap or record in logs).

4.2.3.1 RMON Alarm Configuration

Configure RMON Alarm table on this page. The entry index key is ID.; screen in Figure 4-2-3-1 appears.

Figure 4-2-3-1: RMON Alarm Configuration Page Screenshot

The page includes the following fields:

Object	Description	
• Delete	Check to delete the entry. It will be deleted during the next save.	
• ID	Indicates the index of the entry. The range is from 1 to 65535.	
• Interval	Indicates the interval in seconds for sampling and comparing the rising and	
	falling threshold. The range is from 1 to 2^31-1.	
• Variable	Indicates the particular variable to be sampled; the possible variables are:	
	■ InOctets: The total number of octets received on the interface, including	
	framing characters.	
	■ InUcastPkts: The number of uni-cast packets delivered to a higher-layer	
	protocol.	

	■ InNUcastPkts: The number of broadcast and multi-cast packets delivered
	to a higher-layer protocol.
	■ InDiscards: The number of inbound packets that are discarded even the
	packets are normal.
	■ InErrors: The number of inbound packets that contains errors preventing
	them from being deliverable to a higher-layer protocol.
	■ InUnknownProtos: the number of the inbound packets that is discarded
	because of the unknown or un-support protocol.
	■ OutOctets: The number of octets transmitted out of the interface, including
	framing characters.
	■ OutUcastPkts: The number of uni-cast packets that requests to transmit.
	■ OutNUcastPkts: The number of broadcast and multi-cast packets that
	requests to transmit.
	OutDiscards: The number of outbound packets that is discarded even the
	packets are normal.
	OutErrors: The number of outbound packets that could not be transmitted
	because of errors.
	OutQLen: The length of the output packet queue (in packets).
Sample Type	The method of sampling the selected variable and calculating the value to be
	compared against the thresholds; possible sample types are:
	■ Absolute: Get the sample directly.
	■ Delta: Calculate the difference between samples (default).
• Value	The value of the statistic during the last sampling period.
Startup Alarm	The method of sampling the selected variable and calculating the value to be
	compared against the thresholds; possible sample types are:
	■ Rising Trigger alarm when the first value is larger than the rising threshold.
	■ FallingTrigger alarm when the first value is less than the falling threshold.
	■ RisingOrFallingTrigger alarm when the first value is larger than the rising
	threshold or less than the falling threshold (default).
Rising Threshold	Rising threshold value (-2147483648-2147483647).
Rising Index	Rising event index (1-65535).
Falling Threshold	Falling threshold value (-2147483648-2147483647)
Falling Index	Falling event index (1-65535).

4.2.3.2 RMON Alarm Status

This page provides an overview of RMON Alarm entries. Each page shows up to 99 entries from the Alarm table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Alarm table. The first displayed will be the one with the lowest ID found in the Alarm table; screen in Figure 4-2-3-2 appears.

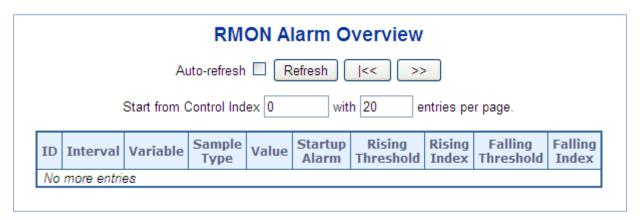

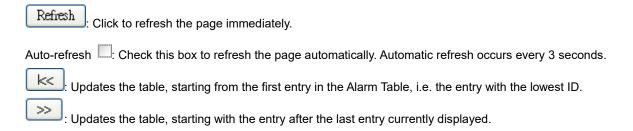

Figure 4-2-3-2: RMON Alarm Overview Page Screenshot

The page includes the following fields:

Object	Description	
• ID	Indicates the index of Alarm control entry.	
• Interval	Indicates the interval in seconds for sampling and comparing the rising and	
	falling threshold.	
Variable	Indicates the particular variable to be sampled.	
Sample Type	The method of sampling the selected variable and calculating the value to be	
	compared against the thresholds.	
• Value	The value of the statistic during the last sampling period.	
Startup Alarm	The alarm that may be sent when this entry is first set to valid.	
Rising Threshold	Rising threshold value	
Rising Index	Rising event index	
Falling Threshold	Falling threshold value	
Falling Index	Falling event index	

Buttons

4.2.3.3 RMON Event Configuration

Configure RMON Event table on this page. The entry index key is **ID**; screen in Figure 4-2-3-3 appears.

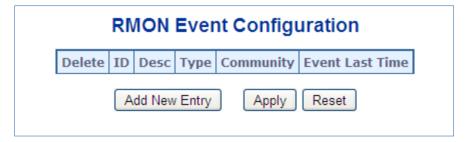

Figure 4-2-3-3 RMON Event Configuration Page Screenshot

The page includes the following fields:

Object	Description		
• Delete	Check to delete the entry. It will be deleted during the next save.		
• ID	Indicates the index of the entry. The range is from 1 to 65535.		
• Desc	Indicates this event, the string length is from 0 to 127, default is a null string.		
• Type	Indicates the notification of the event; the possible types are:		
	■ none: The total number of octets received on the interface, including		
	framing characters.		
	■ log: The number of uni-cast packets delivered to a higher-layer protocol.		
	■ snmptrap: The number of broad-cast and multi-cast packets delivered to a		
	higher-layer protocol.		
	■ logandtrap: The number of inbound packets that are discarded even the		
	packets are normal.		
• Community	Specify the community when trap is sent, the string length is from 0 to 127,		
	default is "public".		
Event Last Time	Indicates the value of sysUpTime at the time this event entry last generated an		
	event.		

Buttons

Add New Entry: Click to add a new community entry.

: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.3.4 RMON Event Status

This page provides an overview of RMON Event table entries. Each page shows up to 99 entries from the Event table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Event table. The first displayed will be the one with the lowest Event Index and Log Index found in the Event table; screen in Figure 4-2-3-4 appears.

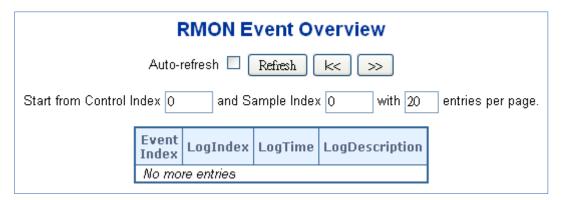

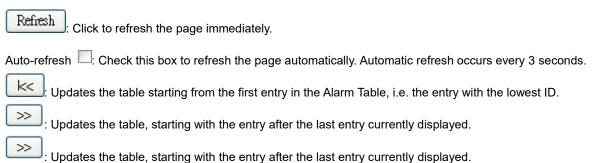

Figure 4-2-3-4: RMON Event Overview Page Screenshot

The page includes the following fields:

Object Description		
• Event Index	Indicates the index of the event entry.	
Log Index	Indicates the index of the log entry.	
• Logtime	Indicates Event log time.	
Log Description	Indicates the Event description.	

Buttons

4.2.3.5 RMON History Configuration

Configure RMON History table on this page. The entry index key is **ID**; screen in Figure 4-2-3-5 appears.

Figure 4-2-3-5: RMON History Configuration Page Screenshot

The page includes the following fields:

Object	Description	
• Delete	Check to delete the entry. It will be deleted during the next save.	
• ID	Indicates the index of the entry. The range is from 1 to 65535.	
Data Source	Indicates the port ID which wants to be monitored.	
• Interval	Indicates the interval in seconds for sampling the history statistics data. The	
	range is from 1 to 3600, default value is 1800 seconds.	
• Buckets	Indicates the maximum data entries associated this History control entry stored	
	in RMON. The range is from 1 to 3600, default value is 50.	
Buckets Granted	The number of data will be saved in the RMON.	

Buttons

Add New Entry Click to add a new community entry. Apply

: Click to apply changes

Reset Click to undo any changes made locally and revert to previously saved values.

4.2.3.6 RMON History Status

This page provides an detail of RMON history entries; screen in Figure 4-2-3-6 appears.

Figure 4-2-3-6: RMON History Overview Page Screenshot

The page includes the following fields:

Object	Description	
History Index	Indicates the index of History control entry.	
Sample Index	Indicates the index of the data entry associated with the control entry.	
Sample Start	The value of sysUpTime at the start of the interval over which this sample was measured.	
• Drop	The total number of events in which packets were dropped by the probe due to lack of resources.	
• Octets	The total number of octets of data (including those in bad packets) received on the network.	
• Pkts	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.	
• Broadcast	The total number of good packets received that were directed to the broadcast address.	
Multicast	The total number of good packets received that were directed to a multicast address.	
CRC Errors	The total number of packets received that had a length (excluding framing bits, but including	
	FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check	
	Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-	
	integral number of octets (Alignment Error).	
• Undersize	The total number of packets received that were less than 64 octets.	
• Oversize	The total number of packets received that were longer than 1518 octets.	
• Frag.	The number of frames whose size is less than 64 octets received with invalid CRC.	
Jabb.	The number of frames whose size is larger than 64 octets received with invalid CRC.	
• Coll.	The best estimate of the total number of collisions in this Ethernet segment.	
• Utilization	The best estimate of the mean physical layer network utilization on this interface during this	
	sampling interval, in hundredths of a percent.	

Buttons

Refresh: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Less : Updates the table, starting from the first entry in the History table, i.e., the entry with the lowest History Index and Sample Index

: Updates the table, starting with the entry after the last entry currently displayed.

4.2.3.7 RMON Statistics Configuration

Configure RMON Statistics table on this page. The entry index key is **ID**; screen in Figure 4-2-3-7 appears.

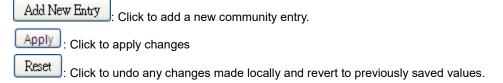

Figure 4-2-3-7: RMON Statistics Configuration Page Screenshot

The page includes the following fields:

Object	Description	
Delete Check to delete the entry. It will be deleted during the next save.		
• ID	Indicates the index of the entry. The range is from 1 to 65535.	
Data Source	Indicates the port ID which wants to be monitored.	

Buttons

4.2.3.8 RMON Statistics Status

This page provides an overview of RMON Statistics entries. Each page shows up to 99 entries from the Statistics table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Statistics table. The first displayed will be the one with the lowest ID found in the Statistics table; screen in Figure 4-2-3-8 appears.

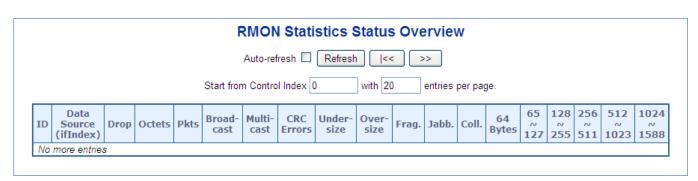

Figure 4-2-3-8: RMON Statistics Status Overview Page Screenshot

The page includes the following fields:

Object	Description	
• ID	Indicates the index of Statistics entry.	
Data Source	The port ID which wants to be monitored.	
(ifIndex)		
• Drop	The total number of events in which packets were dropped by the probe due to lack of	
	resources.	
• Octets	The total number of octets of data (including those in bad packets) received on the	
	network.	
• Pkts	The total number of packets (including bad packets, broadcast packets, and multicast	
	packets) received.	
• Broadcast	The total number of good packets received that were directed to the broadcast address.	
Multicast	The total number of good packets received that were directed to a multicast address.	
CRC Errors	The total number of packets received that had a length (excluding framing bits, but	
	including FCS octets) of between 64 and 1518 octets.	
• Undersize	The total number of packets received that were less than 64 octets.	
• Oversize	The total number of packets received that were longer than 1518 octets.	
• Frag.	The number of frames whose size is less than 64 octets received with invalid CRC.	
Jabb.	The number of frames whose size is larger than 64 octets received with invalid CRC.	
• Coll.	The best estimate of the total number of collisions in this Ethernet segment.	
64 Bytes	The total number of packets (including bad packets) received that were 64 octets in	
	length.	
• 65~127	The total number of packets (including bad packets) received that were between 65 to	
	127 octets in length.	
• 128~255	The total number of packets (including bad packets) received that were between 128 to	
	255 octets in length.	
• 256~511	The total number of packets (including bad packets) received that were between 256 to	
	511 octets in length.	
• 512~1023	The total number of packets (including bad packets) received that were between 512 to	
	1023 octets in length.	
• 1024~1518	The total number of packets (including bad packets) received that were between 1024	
	to 1518 octets in length.	

Buttons

Refresh: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Updates the table, starting with the entry after the last entry currently displayed.

4.2.4 DHCP Relay

(Only applies to switches installed with firmware after vx.2112bxxxxxx)

4.2.4.1 DHCPv4 Relay

A DHCP relay agent is used to forward and to transfer DHCP messages between the clients and the server when they are not in the same subnet domain. It stores the incoming interface IP address in the GIADDR field of the DHCP packet. The DHCP server can use the value of GIADDR field to determine the assigned subnet. For such condition, please make sure the switch configuration of VLAN interface IP address and PVID(Port VLAN ID) correctly.

DHCP Relay Configuration

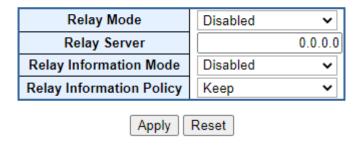

Figure 4-2-4-1: DHCPv4 Relay Configuration

The page includes the following fields:

DHCPv4 Relay

Configure operation mode to enable/disable DHCP server per system.

Object	Description		
Relay Mode	Indicates the DHCP relay mode operation.		
	Possible modes are:		
	Enabled: Enable DHCP relay mode operation. When DHCP relay mode		
	operation is enabled, the agent forwards and transfers DHCP messages		
	between the clients and the server when they are not in the same subnet		
	domain. And the DHCP broadcast message won't be flooded for security		
	considerations.		
	Disabled : Disable DHCP relay mode operation.		
Relay Server	Indicates the DHCP relay server IP address.		
Relay Information	Indicates the DHCP relay information mode option operation. The option 82		
Mode	circuit ID format as "[vlan_id][module_id][port_no]". The first four characters		

represent the VLAN ID, the fifth and sixth characters are the module ID(in standalone device it always equal 0, in stackable device it means switch ID), and the last two characters are the port number. For example, "00030108" means the DHCP message receive form VLAN ID 3, switch ID 1, port No 8. And the option 82 remote ID value is equal the switch MAC address. Possible modes are: Enabled: Enable DHCP relay information mode operation. When DHCP relay information mode operation is enabled, the agent inserts specific information (option 82) into a DHCP message when forwarding to DHCP server and removes it from a DHCP message when transferring to DHCP client. It only works when DHCP relay operation mode is enabled. Disabled: Disable DHCP relay information mode operation. Indicates the DHCP relay information option policy. When DHCP relay information mode operation is enabled, if the agent receives a DHCP message that already contains relay agent information it will enforce the policy. The 'Replace' policy is invalid when relay information mode is disabled. Possible policies are: • Relay Information Replace: Replace the original relay information when a DHCP message that **Policy** already contains it is received. **Keep**: Keep the original relay information when a DHCP message that already contains it is received. **Drop**: Drop the package when a DHCP message that already contains relay information is received.

0	0	0	0	0	0	0

Figure 4-2-4-2: DHCPv4 Relay Statistics

The first part of this page provides statistics for the DHCP server.

Object	Description
Transmit to Server	The number of packets that are relayed from client to server.
Transmit Error	The number of packets that resulted in errors while being sent to clients.
Receive from Server	The number of packets received from server.
Receive Missing Agent Option	The number of packets received without agent information options.
Receive Missing Circuit ID	The number of packets received with the Circuit ID option missing.
Recevie Missing Remote ID	The number of packets received with the Remote ID option missing.
Receive Bad Circuit ID	The number of packets whose Circuit ID option did not match known circuit ID.
Receive Bad Remote	The number of packets whose Remote ID option did not match known Remote
ID	ID.

The second part of this page provides statistics for the Client.

Object Description	
Transmit to Client	The number of relayed packets from server to client.
Transmit Error	The number of packets that resulted in error while being sent to servers.
Receive from Client	The number of received packets from server.
Receive Agent Option	The number of received packets with relay agent information option.
Replace Agent Option	The number of packets which were replaced with relay agent information option.
Keep Agent Option	The number of packets whose relay agent information was retained.
Drop Agent Option	The number of packets that were dropped which were received with relay agent information.

4.2.5 DHCP server

4.2.5.1 DHCP Server Mode Configuration

Configure DHCP server mode on this page. The entry index key is **ID**.; screen in Figure 4-2-5-1 appears.

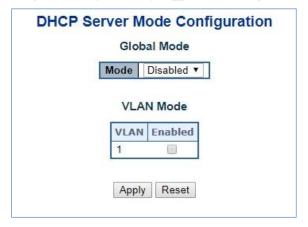

Figure 4-2-5-1: DHCP server mode Page Screenshot

The page includes the following fields:

Object	Description
• Mode	Configure the operation mode per system. Possible modes are:
	Enabled: Enable DHCP server per system.
	Disabled: Disable DHCP server pre system.
VLAN Mode	Configure operation mode to enable/disable DHCP server per VLAN.
VLAN Range	Indicate the VLAN range in which DHCP server is enabled or disabled. The first
	VLAN ID must be smaller than or equal to the second VLAN ID. BUT, if the
	VLAN range contains only 1 VLAN ID, then you can just input it into either one of
	the first and second VLAN ID or both.
	On the other hand, if you want to disable existed VLAN range, then you can
	follow the steps.
	1. press to add a new VLAN range.
	2. input the VLAN range that you want to disable.
	3. choose Mode to be Disabled.
	4. press to apply the change.
	Then, you will see the disabled VLAN range is removed from the DHCP Server
	mode configuration page.
• Mode	■ Indicate the operation mode per VLAN. Possible modes are:
	Enabled: Enable DHCP server per VLAN.
	Disabled: Disable DHCP server pre VLAN.

Buttons

Add VLAN Range : Click to add a new VLAN range.

Apply : Click to apply changes

Reset : Click to undo any changes made locally and revert to previously saved values.

4.2.5.2 DHCP Server excluded IP Configuration

Configure excluded IP addresses. DHCP server will not allocate these excluded IP addresses to DHCP client.; screen in Figure 4-2-5-2 appears.

Figure 4-2-5-2: DHCP server excluded Page Screenshot

The page includes the following fields:

Object	Description
• IP range	Define the IP range to be excluded IP addresses. The first excluded IP must be
	smaller than or equal to the second excluded IP. BUT, if the IP range contains
	only 1 excluded IP, then you can just input it to either one of the first and second
	excluded IP or both.

Buttons

Add IP Range : Click to add a new excluded IP range.

Apply : Click to apply changes

Reset : Click to undo any changes made locally and revert to previously saved values.

4.2.5.3 DHCP Server pool Configuration

This page manages DHCP pools. According to the DHCP pool, DHCP server will allocate IP address and deliver configuration parameters to DHCP client. screen in Figure 4-2-5-3 appears.

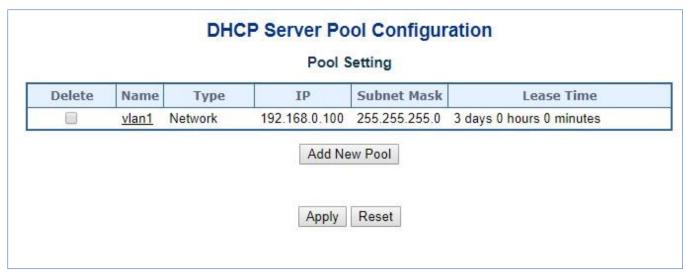

Figure 4-2-5-3: DHCP server pool Page Screenshot

The page includes the following fields:

Object	Description
• Name	Configure the pool name that accepts all printable characters, except white
	space. If you want to configure the detail settings, you can click the pool name to
	go into the configuration page.
• Type	Display which type of the pool is.
	Network: the pool defines a pool of IP addresses to service more than one
	DHCP client.
	Host : the pool services for a specific DHCP client identified by client identifier or
	hardware address.
• IP	Display network number of the DHCP address pool.
	If "-" is displayed, it means not defined
Subnet Mask	Display subnet mask of the DHCP address pool.
	If "-" is displayed, it means not defined.
Lease Time	Display lease time of the pool.

Buttons

Add New Pool

: Click to add a new excluded IP range.

Apply
: Click to apply changes

Reset
: Click to undo any changes made locally and revert to previously saved values.

4.2.5.4 DHCP Server pool Configuration

This page displays the database counters and the number of DHCP messages sent and received by DHCP server.. screen in Figure 4-2-5-4 appears.

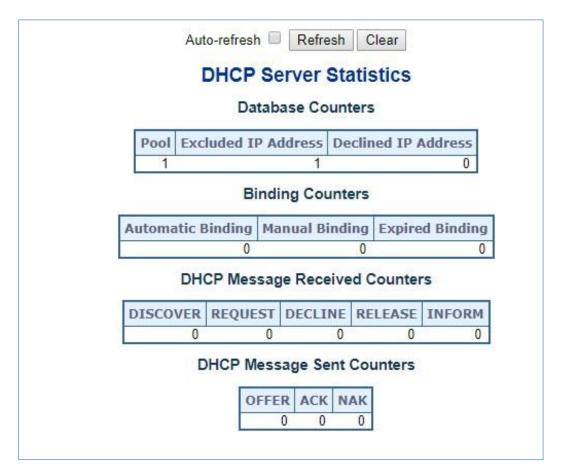

Figure 4-2-5-4: DHCP server Statistics Page Screenshot

The page includes the following fields:

Database Counters

Object	Description
• Pool	Number of pools
Excluded IP Address	Number of excluded IP address ranges
Declined IP Address	Number of declined IP addresses.

Binding Counters

Object	Description
Automatic Binding	Number of bindings with network-type pools
Manual Binding	Number of bindings that administrator assigns an IP address to a client. That is,
	the pool is of host type.
Expired Binding	Number of bindings that their lease time expired or they are cleared from
	Automatic/Manual type bindings.

DHCP message Received Counters

Object	Description
• Discover	Number of DHCP DISCOVER messages received.
• Request	Number of DHCP REQUEST messages received.
• Decline	Number of DHCP DECLINE messages received.
Release	Number of DHCP RELEASE messages received.
• Inform	Number of DHCP INFORM messages received.

DHCP message Sent Counters

Object	Description
• Offer	Number of DHCP OFFER messages sent.
• ACK	Number of DHCP ACK messages sent.
• NAK	Number of DHCP NAK messages sent.

Buttons

Auto-refresh seconds.

: Check this box to refresh the page automatically.

Apply: Click to apply changes

Reset : Click to undo any changes made locally and revert to previously saved values

4.2.5.5 DHCP Server Binding IP Configuration

This page displays bindings generated for DHCP clients. screen in Figure 4-2-5-5 appears.

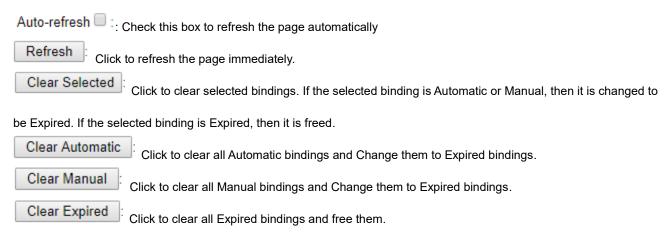

Figure 4-2-5-5: DHCP server Binding IP page Screenshot

The page includes the following fields:

Object	Description
• IP	Display IP address allocated to DHCP client.
• Type	Display type of binding. Possible types are Automatic, Manual, Expired.
• State	Display state of binding. Possible states are Committed, Allocated, Expired
Pool Name	Display the pool that generates the binding.
Server ID	Display server IP address to service the binding.

Buttons

4.2.5.6 DHCP Server Declined IP

This page displays declined IP addresses. screen in Figure 4-2-5-6 appears.

Figure 4-2-5-6: DHCP server Declined IP Page Screenshot

The page includes the following fields:

Object	Description
Delined IP	Display List of IP addresses declined.

Buttons

Auto-refresh : Check this box to refresh the page automatically

Refresh : Click to refresh the page immediately.

4.2.5.7 DHCP Detail Statistics

This page provides statistics for DHCP snooping. Notice that the normal forward per-port TX statistics isn't increased if the incoming DHCP packet is done by L3 forwarding mechanism. And clear the statistics on specific port may not take effect on global statistics since it gathers the different layer overview. screen in Figure 4-2-5-7 appears.

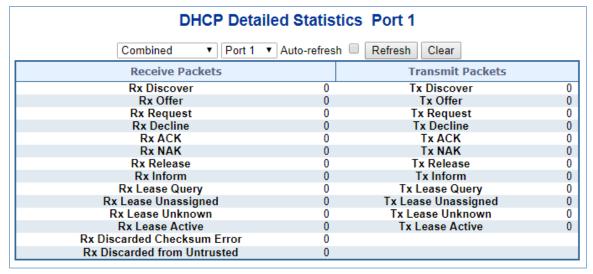

Figure 4-2-5-7: DHCP Detail Statistics page Screenshot

The page includes the following fields:

Object	Description
Rx and Tx Discover	Display the number of discover (option 53 with value 1) packets received and
	transmitted.
Rx and Tx Offer	Display the number of offer (option 53 with value 2) packets received and
	transmitted.
Rx and Tx Request	Display the number of request (option 53 with value 3) packets received and
	transmitted
Rx and Tx Decline	Display the number of decline (option 53 with value 4) packets received and
	transmitted.
Rx and Tx ACK	Display the number of ACK (option 53 with value 5) packets received and
	transmitted.
Rx and Tx NAK	Display the number of NAK (option 53 with value 6) packets received and
	transmitted.
Rx and Tx Release	Display the number of release (option 53 with value 7) packets received and
	transmitted.
Rx and Tx Inform	Display the number of inform (option 53 with value 8) packets received and
	transmitted
Rx and Tx Lease	Display the number of lease query (option 53 with value 10) packets received
Query	and transmitted.
Rx and Tx Lease	Display the number of lease unassigned (option 53 with value 11) packets
Unassigned	received and transmitted.
Rx and Tx Lease	Display the number of lease unknown (option 53 with value 12) packets received
Unknown	and transmitted.
Rx and Tx Lease	Display the number of lease active (option 53 with value 13) packets received
Active	and transmitted
Rx Discarded	Display the number of discard packet that IP/UDP checksum is error.
checksum error	
Rx Discarded from	Display the number of discarded packet that are coming from untrusted port.
Untrusted

4.2.6 Industrial Protocol

With the supported Modbus TCP/IP protocol, the **Industrial Managed Switch** can easily integrate with **SCADA** systems, **HMI** systems and other data acquisition systems in factory floors. It enable administrators to remotely monitor the industrial Ethernet switch's **operating information**, **port information** and **communication status**, thus easily achieving enhanced monitoring and maintenance of the entire factory.

4.2.6.1 Protocol Configuration

The Industrial Protocol Configuration are configured here.; screen in Figure 4-2-6-1 appears.

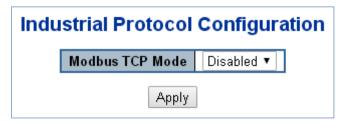

Figure 4-2-6-1: Protocol Configuration Page Screenshot

The page includes the following fields:

Object	Description	
Modbus TCP Mode	Indicates the modbus TCP mode operation. Possible modes are:	
	■ Enabled: Enable modbus TCP mode operation.	
	■ Disabled : Disable modbus TCP mode operation.	

Buttons

Apply: Click to apply changes

4.2.7 Remote Management

Planet provides two ways to remotely manage all kinds of devices: a smartphone application (CloudViewer) designed to monitor network status from the cloud, and a Network Management System (Planet NMS) designed to monitor all deployed network devices, such as managed switches, media converters, routers, smart APs, VoIP phones, and IP cameras.

4.2.7.1 Remote NMS Configuration

Remote NMS Configuration

Figure 4-2-7-1: Remote NMS Configuration

The table below explains the options shown on this page.

Object	Description
Remote NMS Enable	Enable the remote NMS controller management
	The PLANET Managed Switch supports two remote NMS management
	systems:
	PLANET CloudViewer Server - Internet
	It is co-wrok with PLANET CloudViwer app installed on users smartphoe or
	tablet. Users can download the app from Apple store or Google Play and regist
	the user accout throuth the app.
	PLANET NMS Controller - LAN
	It is co-work with PLANET NMS Controller, such as NMS-500, NMS-1000V
	series and UNI-NMS-Lite virtual machine. Users can discovery and add the
	PLANET Managed Switch and other devices from the NMS Controller. And the
	Managed Switch will start to upload switch information and statistics to the NMS
	controller after authorization.
NMS Controller IP	The IP address of remote NMS controller.
address	
Authorization status	Displays the authorization status status for NMS controller, which can be one of
	the following:

	Unauthorzied: The switch is unauthorized for NMS controller.	
	Successful: The switch is authorized for NMS controller.	
	Failed: The authorization of NMS controller is failed.	
	Disabled: The function of remote NMS management is disabled.	
Email and Password	Fill in PLANET CloudViewer account(e-mail address) and password.	
Connection Status	Success- If Cloudviewer server is connected, the connection status	
	show success.	
	• Authentication failed - If the server fails to connect, the connections	
	status will show authentication failed.	

Bottons:

Apply: Click to apply changes

Reset: Click "Undo" to revert all changes before applying.

Unbind : Disconnect the device from the Renote NMS.

4.2.7.2 Planet CloudViewer App

PLANET CloudViewer is an intelligent app for monitoring your cloud network. By making data and services available from anywhere with an internet connection, cloud networks offer unprecedented convenience. With PLANET CloudViewer, you can monitor your network status in real-time from your mobile phone or tablet, no matter where you are. You can easily check device information, port status, and PoE status from the cloud, which reduces management costs.

Four Steps to Manage Devices in the Cloud with Ease

The PLANET CloudViewer App enhances user experience by simplifying the cloud connection setup process. It does not require a lot of time to set up, and even non-technical users can do it within minutes.

Step 1: Download: download App from google play or apple store.

Step 2: Register: Create a PLANET CloudViewer account.

Step 3: Bind: Bind network devices to an account.

Step 4: Get: Open App and enjoy the services

Remote NMS Configuration

Status	not Enable	
Apply unbind		

Figure 4-2-7-2: PLANET CloudViewer App Binding Configuration

After downloading the CloudViewer app on the mobile phone and complete registration, go back to the media converter's web UI and select PLANET CloudViewer Server - Internet in the Remote NMS Configuration page. Enter your account information and apply the setting to bind the media converter to the CloudViewer server. Once the Status shows "success", the media converter is ready to be monitored on your mobile phone.

Figure 4-2-7-3: The screenshot of IGS-6325-24UP4X being monitored on a mobile phone

4.3 Switching

4.3.1 Port Management

Use the Port Menu to display or configure the **Industrial Managed Switch**'s ports. This section has the following items:

Port Configuration Configures port connection settings
 Port Statistics Overview Lists Ethernet and RMON port statistics
 Port Statistics Detail Lists Ethernet and RMON port statistics
 SFP Module Information Display SFP information
 Port Mirror Sets the source and target ports for mirroring

4.3.1.1 Port Configuration

This page displays current port configurations. Ports can also be configured here. The Port Configuration screen in Figure 4-3-1-1 and Figure 4-3-1-2 appears.

Port Configuration

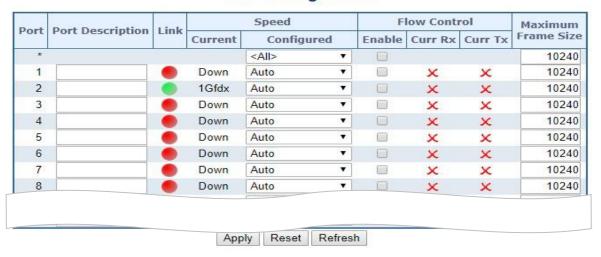

Figure 4-3-1-1: Port Configuration Page Screenshot

Port Configuration

Figure 4-3-1-2: Port Configuration Page Screenshot

(Only applies to switches installed with firmware after vx.2112bxxxxxxx)

The page includes the following fields:

Object	Description		
• Port	This is the logical port number for this row.		
• Port Description	Indicates the per port description.		
• Link	The current link state is displayed graphically. Green indicates the link is up and		
	red indicates the link is down.		
• Warning	Operational warnings of the port.		
	No warnings		
	: There are warnings, use tooltip to see.		
Current Link Speed	Provides the current link speed of the port.		
Configured Link Speed	Select any available link speed for the given switch port. Draw the menu bar to		
	select the mode.		
	Auto - Set up Auto negotiation for copper interface.		
	■ 10Mbps HDX - Force sets 10Mbps/Half-Duplex mode.		
	■ 10Mbps FDX - Force sets 10Mbps/Full-Duplex mode.		
	■ 100Mbps HDX - Force sets 100Mbps/Half-Duplex mode.		
	■ 100Mbps FDX - Force sets 100Mbps/Full-Duplex mode.		
	■ 1Gbps FDX - Force sets 1000Mbps/Full-Duplex mode.		
	■ 1G FDX - Forces sets 1Gbps/Full-Duplex mode.		
	■ 2.5G FDX - Forces the port in 2.5Gbps full duplex mode.		
	■ 10G FDX - Forces sets 10Gbps/Full-Duplex mode.		
	■ Disable - Shut down the port manually.		
 Advertise Duplex 	When duplex is set as auto i.e auto negotiation, the port will only advertise the		
	specified duplex as either Fdx or Hdx to the link partner. By default port will		
	advertise all the supported duplexes if the Duplex is Auto.		
Advertise Speed	When Speed is set as auto i.e auto negotiation, the port will only advertise the		
	specified speeds (10M 100M 1G 2.5G 5G 10G) to the link partner. By default		
	port will advertise all the supported speeds if speed is set as Auto.		
Flow Control	When Auto Speed is selected on a port, this section indicates the flow control		
	capability that is advertised to the link partner.		
	When a fixed-speed setting is selected, that is what is used. The Current Rx		
	column indicates whether pause frames on the port are obeyed, and the Current		
	Tx column indicates whether pause frames on the port are transmitted. The Rx		
	and Tx settings are determined by the result of the last Auto-Negotiation.		
	Check the configured column to use flow control. This setting is related to the		
	setting for Configured Link Speed.		
• PFC	When PFC (802.1Qbb Priority Flow Control) is enabled on a port then flow		
	control on a priority level is enabled. Through the Priority field, range (one or		
	more) of priorities can be configured, e.g. '0-3,7' which equals '0,1,2,3,7'. PFC is		

not supported through auto negotiation. PFC and Flowcontrol cannot both be enabled on the same port. • Maximum Frame Size Enter the maximum frame size allowed for the switch port, including FCS. The allowed range is 1518 bytes to 10056 bytes. • Excessive Collision Mode Configure port transmit collision behavior. Discard: Discard frame after 16 collisions (default). Restart: Restart backoff algorithm after 16 collisions. • Frame Length Check Configures if frames with incorrect frame length in the EtherType/Length field shall be dropped. An Ethernet frame contains a field EtherType/Which can be used to indicate the frame payload size (in bytes) for values of 1535 and below. If the EtherType/Length field is above 1535, it indicates that the field is used as an EtherType (indicating which protocol is encapsulated in the payload of the frame). If "frame length check" is enabled, frames with payload size less than 1536 bytes are dropped, if the EtherType/Length field does not match the actually payload length. If "frame length check" is disabled, frames are not dropped due to frame length mismatch. Note: No drop counters count frames dropped due to frame length mismatch. Note: No drop counters count frames dropped due to frame length mismatch. • FEC FEC is short for Forward Error Correction. It is a technique for controlling errors over an unreliable link. The idea is that the sender adds some extra bits to the frame that allows a receiver to correct bit errors in the received frame. R-FEC (IEEE802.3 clause 74 - sometimes called Firecode). This is meant for 10G. The parameter affects both what is requested during clause 73 aneg and what the port is configured to use if not running clause 73 aneg. If running clause 73 aneg and 10G ports we always tell the link partner that we support R-FEC. What the end user can control with the fec command is whether we request R-FEC. If either us or the link partner requests R-FEC, the port will end up using R-FEC. auto: This is the default and means the following: If

Note: No drop counters count frames dropped due to frame length mismatch with the sender adds some extra bits to the frame that allows a receiver to correct bit errors in the received frame. FEC Is short for Forward Error Correction. It is a technique for controlling errors over an unreliable link. The idea is that the sender adds some extra bits to the frame that allows a receiver to correct bit errors in the received frame. R-FEC (IEEE802.3 clause 74 - sometimes called Firecode). This is meant for 10G. The parameter affects both what is requested during clause 73 aneg and what the port is configured to use if not running clause 73 aneg. If running clause 73 aneg on 10G ports we always tell the link partner that we support R-FEC. What the end user can control with the fec command is whether we request R-FEC. If either us or the link partner requests R-FEC, the port will end up using R-FEC. auto: This is the default and means the following: If a 10G port runs clause 73, R-FEC will be requested. Otherwise, no FEC will be enabled. P-fec: If a 10G port runs clause 73, only R-FEC will be requested. If a 10G port does not run clause 73, but is loaded with at least a 10G SFP and the speed is at least 5G, only R-FEC will be enabled	• Excessive Collision	Configure port transmit collision behavior.
Frame Length Check Configures if frames with incorrect frame length in the EtherType/Length field shall be dropped. An Ethernet frame contains a field EtherType which can be used to indicate the frame payload size (in bytes) for values of 1535 and below. If the EtherType/Length field is above 1535, it indicates that the field is used as an EtherType (indicating which protocol is encapsulated in the payload of the frame). If "frame length check" is enabled, frames with payload size less than 1536 bytes are dropped, if the EtherType/Length field does not match the actually payload length. If "frame length check" is disabled, frames are not dropped due to frame length mismatch. Note: No drop counters count frames dropped due to frame length mismatch. Note: No drop counters count frames dropped due to frame length mismatch with the sender adds some extra bits to the frame that allows a receiver to correct bit errors in the received frame. FEC FEC is short for Forward Error Correction. It is a technique for controlling errors over an unreliable link. The idea is that the sender adds some extra bits to the frame that allows a receiver to correct bit errors in the received frame. R-FEC (IEEE802.3 clause 74 - sometimes called Firecode). Figure 4-3-1-4: Detailed Port Statistics Port 1 Page Screenshot

The page includes the following fields:

Receive Total and Transmit Total

Object	Description
Rx and Tx Packets	The number of received and transmitted (good and bad) packets
Rx and Tx Octets	The number of received and transmitted (good and bad) bytes, including FCS,
	but excluding framing bits.
Rx and Tx Unicast	The number of received and transmitted (good and bad) unicast packets.
Rx and Tx Multicast	The number of received and transmitted (good and bad) multicast packets.
Rx and Tx Broadcast	The number of received and transmitted (good and bad) broadcast packets.
Rx and Tx Pause	A count of the MAC Control frames received or transmitted on this port that has
	an opcode indicating a PAUSE operation.

Receive and Transmit Size Counters

The number of received and transmitted (good and bad) packets split into categories based on their respective frame sizes.

Receive and Transmit Queue Counters

The number of received and transmitted packets per input and output queue.

Receive Error Counters

Object	Description
• Rx Drops	The number of frames dropped due to lack of receive buffers or egress
	congestion.
Rx CRC/Alignment	The number of frames received with CRC or alignment errors.
Rx Undersize	The number of short frames received with valid CRC.
Rx Oversize	The number of long frames received with valid CRC.
Rx Fragments	The number of short frames received with invalid CRC.
Rx Jabber	The number of long frames received with invalid CRC.
Rx Filtered	The number of received frames filtered by the forwarding process.
	Short frames are frames that are smaller than 64 bytes.
	Long frames are frames that are longer than the configured maximum
	frame length for this port.

- 1 Short frames are frames that are smaller than 64 bytes.
- 2 Long frames are frames that are longer than the configured maximum frame length for this port.

Transmit Error Counters

Object	Description
• Tx Drops	The number of frames dropped due to output buffer congestion.
Tx Late/Exc. Coll.	The number of frames dropped due to excessive or late collisions.

4.3.1.4 SFP Module Information

The **Industrial Managed Switches** have supported the SFP module with **digital diagnostics monitoring (DDM)** function. This feature is also known as digital optical monitoring (DOM). You can check the physical or operational status of an SFP module via the SFP Module Information page. This page shows the operational status, such as the transceiver type, speed, wavelength, optical output power, optical input power, temperature, laser bias current and transceiver supply voltage in real time. You can also use the hyperlink of port no. to check the statistics on a specific interface. The SFP Module Information screen in Figure 4-3-1-5 appears.

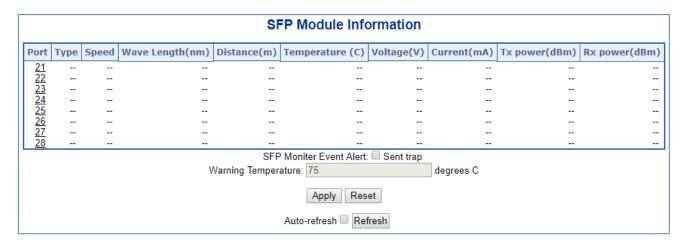

Figure 4-3-1-5: SFP Module Information for Switch Page Screenshot

The page includes the following fields:

Object	Description
• Type	Display the type of current SFP module; the possible types are:
	■ 10GBASE-SR
	■ 10GBASE-LR
	■ 1000BASE-SX
	■ 1000BASE-LX
	■ 100BASE-FX
• Speed	Display the speed of current SFP module; the speed value or description is got
	from the SFP module. Different vendors SFP modules might show different
	speed information.
Wave Length (nm)	Display the wavelength of current SFP module; the wavelength value is got from
	the SFP module. Use this column to check if the wavelength values of two
	nodes are matched while the fiber connection failed.
Distance (m)	Display the support distance of current SFP module; the distance value is got
	from the SFP module.
Temperature (C)	Display the temperature of current SFP DDM module; the temperature value is
- SFP DDM Module Only	got from the SFP DDM module.
• Voltage(V)	Display the voltage of current SFP DDM module; the voltage value is got from
- SFP DDM Module Only	the SFP DDM module.

Current(mA)	Display the Ampere of current SFP DDM module; the Ampere value is got from
- SFP DDM Module Only	the SFP DDM module.
TX power (dBm)	Display the TX power of current SFP DDM module; the TX power value is got
- SFP DDM Module Only	from the SFP DDM module.
RX power (dBm)	Display the RX power of current SFP DDM module; the RX power value is got
- SFP DDM Module Only	from the SFP DDM module.

4.3.1.5 Port Mirror

Configure port Mirroring on this page. This function provides monitoring network traffic that forwards a copy of each incoming or outgoing packet from one port of a network Switch to another port where the packet can be studied. It enables the manager to keep close track of switch performance and alter it if necessary.

- To debug network problems, selected traffic can be copied, or mirrored, to a mirror port where a frame analyzer can be attached to analyze the frame flow.
- The **Industrial Managed Switch** can unobtrusively mirror traffic from any port to a monitor port. You can then attach a protocol analyzer or RMON probe to this port to perform traffic analysis and verify connection integrity.

Port Mirror Application

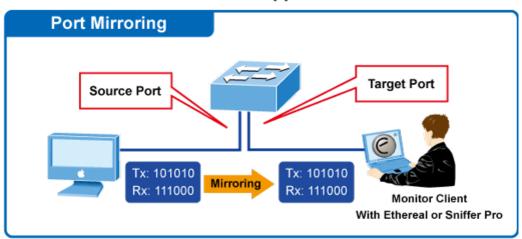

Figure 4-3-1-6: Port Mirror Application

The traffic to be copied to the mirror port is selected as follows:

- · All frames received on a given port (also known as ingress or source mirroring).
- All frames transmitted on a given port (also known as egress or destination mirroring).

Mirror Port Configuration

The Port Mirror screen in Figure 4-3-1-7 appears.and click the session ID to Figure 4-3-1-8

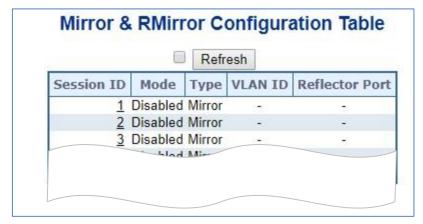

Figure 4-3-1-7: Mirror Configuration Page Screenshot

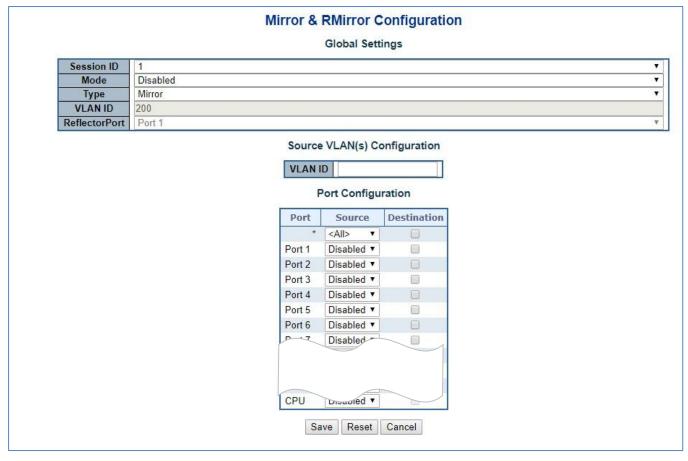

Figure 4-3-1-8: Mirror Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Session	Select session id to configure.
• Mode	To Enabled/Disabled the mirror or Remote Mirroring function
• Type	Mirror
	The switch is running on mirror mode.
	The <u>source port(s)</u> and <u>destination port</u> are located on this switch.
	Source
	The switch is a source node for monitor flow.
	The source port(s), reflector port are located on this switch.
	RMirror destination
	The switch is an end node for monitor flow.
	The destination port(s) is located on this switch.
VLAN ID	The VLAN ID points out where the monitor packet will copy to. The default VLAN ID is
	200.
Reflector Port	The reflector port is a method to redirect the traffic to Remote Mirroring VLAN. Any

	device connected to a port set as a reflector port loses connectivity until the Remote									
	Mirroring is disabled.									
	In the stacking mode, you need to select switch ID to select the correct device. If you shut down a port, it cannot be a candidate for reflector port.									
	If you shut down a port, it cannot be a candidate for reflector port.									
	If you shut down the port which is a reflector port, the remote mirror function cannot									
	work									
Source VLAN(s)	The switch can supports VLAN-based Mirroring. If you want to monitor some VLANs									
Configuration	on the switch, you can set the selected VLANs on this field.									
Remote Mirroring	The following table is used for port role selecting.									
Port Configuration	■ Port: The logical port for the settings contained in the same row									
	Source: Select mirror mode.									
	Disabled Neither frames transmitted nor frames received are mirrored.									
	Both Frames received and frames transmitted are mirrored on the Destination									
	port.									
	Rx only Frames received on this port are mirrored on the Destination port .									
	Frames transmitted are not mirrored.									
	Tx only Frames transmitted on this port are mirrored on the Destination port .									
	Frames received are not mirrored									
	■ Destination: Select destination port.									
	This checkbox is designed for mirror or Remote Mirroring.									
	The destination port is a switched port that you receive a copy of traffic from									
	the source port.									

For a given port, a frame is only transmitted once. It is therefore not possible to mirror Tx frames on the **mirror port**. Because of this, **mode** for the selected mirror port is limited to **Disabled** or **Rx only**.

4.3.2 Link Aggregation

Port Aggregation optimizes port usage by linking a group of ports together to form a single Link Aggregated Groups (LAGs). Port Aggregation multiplies the bandwidth between the devices, increases port flexibility, and provides link redundancy.

Each LAG is composed of ports of the same speed, set to full-duplex operations. Ports in a LAG, can be of different media types (UTP/Fiber, or different fiber types), provided they operate at the same speed.

Aggregated Links can be assigned manually (**Port Trunk**) or automatically by enabling Link Aggregation Control Protocol (**LACP**) on the relevant links.

Aggregated Links are treated by the system as a single logical port. Specifically, the Aggregated Link has similar port attributes to a non-aggregated port, including auto-negotiation, speed, Duplex setting, etc.

The device supports the following Aggregation links:

- Static LAGs (Port Trunk) Force aggregared selected ports to be a trunk group.
- Link Aggregation Control Protocol (LACP) LAGs LACP LAG negotiate Aggregated Port links with other LACP ports located on a different device. If the other device ports are also LACP ports, the devices establish a LAG between them.

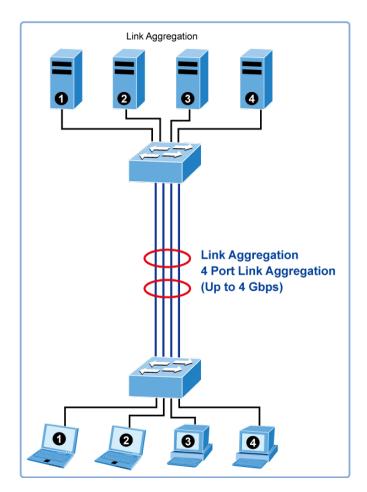

Figure 4-3-2-1: Link Aggregation

The **Link Aggregation Control Protocol** (**LACP**) provides a standardized means for exchanging information between Partner Systems that require high speed redundant links. Link aggregation lets you group up to eight consecutive ports into a single dedicated connection. This feature can expand bandwidth to a device on the network. LACP operation requires full-duplex mode, more detail information refer to the IEEE 802.3ad standard.

Port link aggregations can be used to increase the bandwidth of a network connection or to ensure fault recovery. Link aggregation lets you group up to 4 consecutive ports into a single dedicated connection between any two the Switch or other Layer 2 switches. However, before making any physical connections between devices, use the Link aggregation Configuration menu to specify the link aggregation on the devices at both ends. When using a port link aggregation, note that:

- The ports used in a link aggregation must all be of the same media type (RJ45, 100 Mbps fiber).
- The ports that can be assigned to the same link aggregation have certain other restrictions (see below).
- · Ports can only be assigned to one link aggregation.
- The ports at both ends of a connection must be configured as link aggregation ports.
- None of the ports in a link aggregation can be configured as a mirror source port or a mirror target port.
- All of the ports in a link aggregation have to be treated as a whole when moved from/to, added or deleted from a VLAN.
- The Spanning Tree Protocol will treat all the ports in a link aggregation as a whole.
- Enable the link aggregation prior to connecting any cable between the switches to avoid creating a data loop.
- Disconnect all link aggregation port cables or disable the link aggregation ports before removing a port link aggregation to avoid creating a data loop.

It allows a maximum of 10 ports to be aggregated at the same time. The **Industrial Managed Switch** support Gigabit Ethernet ports (up to 5 groups). If the group is defined as a LACP static link aggregation group, then any extra ports selected are placed in a standby mode for redundancy if one of the other ports fails. If the group is defined as a local static link aggregation group, then the number of ports must be the same as the group member ports.

The aggregation code ensures that frames belonging to the same frame flow (for example, a TCP connection) are always forwarded on the same link aggregation member port. Recording of frames within a flow is therefore not possible. The aggregation code is based on the following information:

- Source MAC
- Destination MAC
- · Source and destination IPv4 address.
- Source and destination TCP/UDP ports for IPv4 packets

Normally, all 5 contributions to the aggregation code should be enabled to obtain the best traffic distribution among the link aggregation member ports. Each link aggregation may consist of up to 10 member ports. Any quantity of link aggregation s may be configured for the device (only limited by the quantity of ports on the device.) To configure a proper traffic distribution, the ports within a link aggregation must use the same link speed.

4.3.2.1 Static Aggregation

This page is used to configure the Aggregation hash mode and the aggregation group. The aggregation hash mode settings are global.

Hash Code Contributors

The Static Aggregation screen in Figure 4-3-2-2 appears.

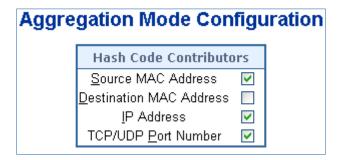

Figure 4-3-2-2: Aggregation Mode Configuration Page Screenshot

The page includes the following fields:

Object	Description
Source MAC Address	The Source MAC address can be used to calculate the destination port for the
	frame. Check to enable the use of the Source MAC address, or uncheck to
	disable. By default, Source MAC Address is enabled.
Destination MAC	The Destination MAC Address can be used to calculate the destination port for
Address	the frame. Check to enable the use of the Destination MAC Address, or uncheck
	to disable. By default, Destination MAC Address is disabled.
IP Address	The IP address can be used to calculate the destination port for the frame.
	Check to enable the use of the IP Address, or uncheck to disable. By default, IP
	Address is enabled.
TCP/UDP Port Number	The TCP/UDP port number can be used to calculate the destination port for the
	frame. Check to enable the use of the TCP/UDP Port Number, or uncheck to
	disable. By default, TCP/UDP Port Number is enabled.

Figure 4-3-2-3: Aggregation Group Configuration Page Screenshot

The page includes the following fields:

.Object	Description								
Group ID	Indicates the group ID for the settings contained in the same row. Group ID								
	"Normal" indicates there is no aggregation. Only one group ID is valid per port.								
• Port Members	Each switch port is listed for each group ID. Select a radio button to include a								
	port in an aggregation, or clear the radio button to remove the port from the								
	aggregation. By default, no ports belong to any aggregation group.								
• Mode	This parameter determines the mode for the aggregation group.								
	Disabled: The group is disabled.								
	Static: The group operates in static aggregation mode.								
	LACP (Active): The group operates in LACP active aggregation mode.								
	See IEEE 801.AX-2014, section 6.4.1 for details.								
	LACP (Passive): The group operates in LACP passive aggregation mode.								
	See IEEE 801.AX-2014, section 6.4.1 for details.								
Revertive	This parameter only applies to LACP-enabled groups. It determines if the group								
	will perform automatic link (re-)calculation when links with higher priority								
	becomes available.								
Max Bundle	This parameter only applies to LACP-enabled groups. It determines the								
	maximum number of active bundled LACP ports allowed in an aggregation.

4.3.2.3 LACP Configuration

Link Aggregation Control Protocol (LACP) - LACP LAG negotiate Aggregated Port links with other LACP ports located on a different device. LACP allows switches connected to each other to discover automatically whether any ports are member of the same LAG.

This page allows the user to inspect the current LACP port configurations, and possibly change them as well. The LACP Configuration screen in Figure 4-3-2-5 appears.

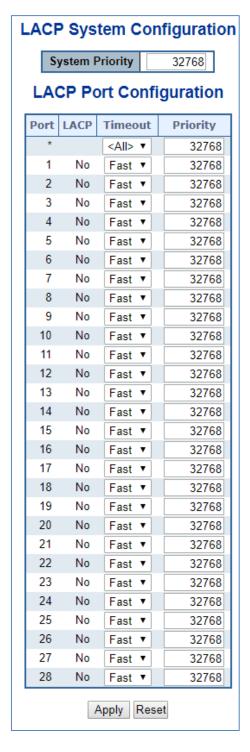

Figure 4-3-2-5: LACP Port Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Port	The switch port number.
LACP Enabled	Controls whether LACP is enabled on this switch port. LACP will form an
	aggregation when 2 or more ports are connected to the same partner.
• Timeout	The Timeout controls the period between BPDU transmissions. Fast will transmit
	LACP packets each second, while Slow will wait for 30 seconds before sending
	a LACP packet.
• Priority	The Priority controls the priority of the port. If the LACP partner wants to form a
	larger group than is supported by this device then this parameter will control
	which ports will be active and which ports will be in a backup role. Lower number
	means greater priority.

Auto-refresh: Automatic refresh occurs every 3 seconds.

4.3.2.5 LACP Internal Port Status

This page provides a status overview of LACP status for all ports. The LACP Internal Port Status screen in Figure 4-5-2-7 appears.

Figure 4-3-2-7: LACP Status Page Screenshot

The page includes the following fields:

Object	Description			
• Port	The switch port number.			
• State	The current port state:			
	Down: The port is not active.			
	Active: The port is in active state.			
	Standby: The port is in standby state.			
• Key	The key assigned to this port. Only ports with the same key can aggregate			
	together.			
• Priority	The priority assigned to this aggregation group.			
• Activity	The LACP mode of the group (Active or Passive).			
• Timeout	The timeout mode configured for the port (Fast or Slow).			
Aggregation	Show whether the system considers this link to be "aggregateable"; i.e., a			
	potential candidate for aggregation.			
 Synchronization 	Show whether the system considers this link to be "IN_SYNC"; i.e., it has been			
	allocated to the correct LAG, the group has been associated with a compatible			
	Aggregator, and the identity of the LAG is consistent with the System ID and			
	operational Key information transmitted.			
Collecting	Show if collection of incoming frames on this link is enabled.			
• Distributing	Show if distribution of outgoing frames on this link is enabled.			
• Defaulted	Show if the Actor's Receive machine is using Defaulted operational Partner			
	information.			
• Expired	Show if that the Actor's Receive machine is in the EXPIRED state.

Auto-refresh: Automatic refresh occurs every 3 seconds.

Clear: Clears the counters for all ports.

4.3.3 VLAN

4.3.3.1 VLAN Overview

A Virtual Local Area Network (VLAN) is a network topology configured according to a logical scheme rather than the physical layout. VLAN can be used to combine any collection of LAN segments into an autonomous user group that appears as a single LAN. VLAN also logically segment the network into different broadcast domains so that packets are forwarded only between ports within the VLAN. Typically, a VLAN corresponds to a particular subnet, although not necessarily.

VLAN can enhance performance by conserving bandwidth, and improve security by limiting traffic to specific domains.

A VLAN is a collection of end nodes grouped by logic instead of physical location. End nodes that frequently communicate with each other are assigned to the same VLAN, regardless of where they are physically on the network. Logically, a VLAN can be equated to a broadcast domain, because broadcast packets are forwarded to only members of the VLAN on which the broadcast was initiated.

- No matter what basis is used to uniquely identify end nodes and assign these nodes VLAN 1. membership, packets cannot cross VLAN without a network device performing a routing function between the VLANs.
- The Industrial Managed Switch supports IEEE 802.1Q VLAN. The port untagging function can be used to remove the 802.1 tag from packet headers to maintain compatibility with devices that are tag-unaware..

The Industrial Managed Switch 's default is to assign all ports to a single 802.1Q VLAN named DEFAULT VLAN. As new VLAN is created, the member ports assigned to the new VLAN will be removed from the DEFAULT VLAN port member list. The DEFAULT VLAN has a VID = 1.

This section has the following items:

VLAN Port Configuration Enables VLAN group

VLAN Membership Status Displays VLAN membership status

VLAN Port Status Displays VLAN port status

Private VLAN Creates/removes primary or community VLANs

Port Isolation Enables/disablse port isolation on port

MAC-based VLAN Configures the MAC-based VLAN entries

MAC-based VLAN Status Displays MAC-based VLAN entries

Protocol-based VLAN Configures the protocol-based VLAN entries

Protocol-based VLAN Displays the protocol-based VLAN entries

Membership

4.3.3.2 IEEE 802.1Q VLAN

In large networks, routers are used to isolate broadcast traffic for each subnet into separate domains. This **Industrial**Managed Switch provides a similar service at Layer 2 by using VLANs to organize any group of network nodes into separate broadcast domains. VLANs confine broadcast traffic to the originating group, and can eliminate broadcast storms in large networks. This also provides a more secure and cleaner network environment.

An IEEE 802.1Q VLAN is a group of ports that can be located anywhere in the network, but communicate as though they belong to the same physical segment.

VLANs help to simplify network management by allowing you to move devices to a new VLAN without having to change any physical connections. VLANs can be easily organized to reflect departmental groups (such as Marketing or R&D), usage groups (such as e-mail), or multicast groups (used for multimedia applications such as videoconferencing).

VLANs provide greater network efficiency by reducing broadcast traffic, and allow you to make network changes without having to update IP addresses or IP subnets. VLANs inherently provide a high level of network security since traffic must pass through a configured Layer 3 link to reach a different VLAN.

This Industrial Managed Switch supports the following VLAN features:

- Up to 255 VLANs based on the IEEE 802.1Q standard
- Port overlapping, allowing a port to participate in multiple VLANs
- End stations can belong to multiple VLANs
- Passing traffic between VLAN-aware and VLAN-unaware devices
- Priority tagging

■ IEEE 802.1Q Standard

IEEE 802.1Q (tagged) VLAN is implemented on the Switch. 802.1Q VLAN requires tagging, which enables them to span the entire network (assuming all switches on the network are IEEE 802.1Q-compliant).

VLAN allows a network to be segmented in order to reduce the size of broadcast domains. All packets entering a VLAN will only be forwarded to the stations (over IEEE 802.1Q enabled switches) that are members of that VLAN, and this includes broadcast, multicast and unicast packets from unknown sources.

VLAN can also provide a level of security to your network. IEEE 802.1Q VLAN will only deliver packets between stations that are members of the VLAN. Any port can be configured as either **tagging** or **untagging**.:

- The untagging feature of IEEE 802.1Q VLAN allows VLAN to work with legacy switches that don't recognize VLAN tags in packet headers.
- The tagging feature allows VLAN to span multiple 802.1Q-compliant switches through a single physical connection and allows Spanning Tree to be enabled on all ports and work normally.

Some relevant terms:

- Tagging The act of putting 802.1Q VLAN information into the header of a packet.
- Untagging The act of stripping 802.1Q VLAN information out of the packet header.

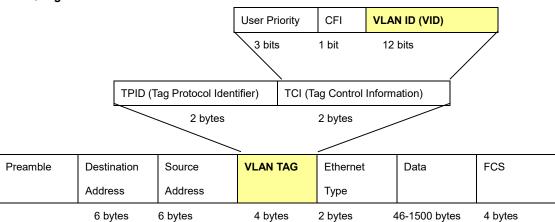

802.1Q VLAN Tags

The figure below shows the 802.1Q VLAN tag. There are four additional octets inserted after the source MAC address. Their presence is indicated by a value of 0x8100 in the Ether Type field. When a packet's Ether Type field is equal to 0x8100, the packet carries the IEEE 802.1Q/802.1p tag. The tag is contained in the following two octets and consists of 3 bits of user priority, 1 bit of Canonical Format Identifier (CFI - used for encapsulating Token Ring packets so they can be carried across Ethernet backbones), and 12 bits of VLAN ID (VID). The 3 bits of user priority are used by 802.1p. The VID is the VLAN identifier and is used by the 802.1Q standard. Because the VID is 12 bits long, 4094 unique VLAN can be identified.

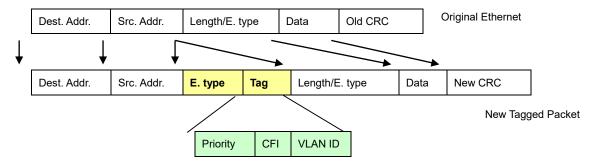

The tag is inserted into the packet header making the entire packet longer by 4 octets. All of the information originally contained in the packet is retained.

The Ether Type and VLAN ID are inserted after the MAC source address, but before the original Ether Type/Length or Logical Link Control. Because the packet is now a bit longer than it was originally, the Cyclic Redundancy Check (CRC) must be recalculated.

Adding an IEEE802.1Q Tag

Port VLAN ID

Packets that are tagged (are carrying the 802.1Q VID information) can be transmitted from one 802.1Q compliant network device to another with the VLAN information intact. This allows 802.1Q VLAN to span network devices (and indeed, the entire network – if all network devices are 802.1Q compliant).

Every physical port on a switch has a PVID. 802.1Q ports are also assigned a PVID, for use within the switch. If no VLAN are defined on the switch, all ports are then assigned to a default VLAN with a PVID equal to 1. Untagged packets are assigned the PVID of the port on which they were received. Forwarding decisions are based upon this PVID, in so far as VLAN are concerned. Tagged packets are forwarded according to the VID contained within the tag. Tagged packets are also assigned a PVID, but the PVID is not used to make packet forwarding decisions, the VID is.

Tag-aware switches must keep a table to relate PVID within the switch to VID on the network. The switch will compare the VID of a packet to be transmitted to the VID of the port that is to transmit the packet. If the two VID are different the switch will drop the packet. Because of the existence of the PVID for untagged packets and the VID for tagged packets, tag-aware and tag-unaware network devices can coexist on the same network.

A switch port can have only one PVID, but can have as many VID as the switch has memory in its VLAN table to store them.

Because some devices on a network may be tag-unaware, a decision must be made at each port on a tag-aware device before packets are transmitted – should the packet to be transmitted have a tag or not? If the transmitting port is connected to a tag-unaware device, the packet should be untagged. If the transmitting port is connected to a tag-aware device, the packet should be tagged.

Default VLANs

The Switch initially configures one VLAN, VID = 1, called "default." The factory default setting assigns all ports on the Switch to the "default". As new VLAN are configured in Port-based mode, their respective member ports are removed from the "default."

Assigning Ports to VLANs

Before enabling VLANs for the switch, you must first assign each port to the VLAN group(s) in which it will participate. By default all ports are assigned to VLAN 1 as untagged ports. Add a port as a tagged port if you want it to carry traffic for one or more VLANs, and any intermediate network devices or the host at the other end of the connection supports VLANs. Then assign ports on the other VLAN-aware network devices along the path that will carry this traffic to the same VLAN(s), either manually or dynamically using GVRP. However, if you want a port on this switch to participate in one or more VLANs, but none of the intermediate network devices nor the host at the other end of the connection supports VLANs, then you should add this port to the VLAN as an untagged port.

VLAN-tagged frames can pass through VLAN-aware or VLAN-unaware network interconnection devices, but the VLAN tags should be stripped off before passing it on to any end-node host that does not support VLAN tagging.

VLAN Classification

When the switch receives a frame, it classifies the frame in one of two ways. If the frame is untagged, the switch assigns the frame to an associated VLAN (based on the default VLAN ID of the receiving port). But if the frame is tagged, the switch uses the tagged VLAN ID to identify the port broadcast domain of the frame.

Port Overlapping

Port overlapping can be used to allow access to commonly shared network resources among different VLAN groups, such as file servers or printers. Note that if you implement VLANs which do not overlap, but still need to communicate, you can connect them by enabled routing on this switch.

Untagged VLANs

Untagged (or static) VLANs are typically used to reduce broadcast traffic and to increase security. A group of network users assigned to a VLAN form a broadcast domain that is separate from other VLANs configured on the switch. Packets are forwarded only between ports that are designated for the same VLAN. Untagged VLANs can be used to manually isolate user groups or subnets.

4.3.3.3 VLAN Port Configuration

This page is used for configuring the **Industrial Managed Switch** port VLAN. The VLAN per Port Configuration page contains fields for managing ports that are part of a VLAN. The port default VLAN ID (PVID) is configured on the VLAN Port Configuration page. All untagged packets arriving to the device are tagged by the ports PVID.

Understanding nomenclature of the Switch

■ IEEE 802.1Q Tagged and Untagged

Every port on an 802.1Q compliant switch can be configured as tagged or untagged.

- Tagged:
- Ports with tagging enabled will put the VID number, priority and other VLAN information into the header of all packets that flow into those ports. If a packet has previously been tagged, the port will not alter the packet, thus keeping the VLAN information intact. The VLAN information in the tag can then be used by other 802.1Q compliant devices on the network to make packet-forwarding decisions.
- Untagged:

Ports with untagging enabled will strip the 802.1Q tag from all packets that flow into those ports. If the packet doesn't have an 802.1Q VLAN tag, the port will not alter the packet. Thus, all packets received by and forwarded by an untagging port will have no 802.1Q VLAN information. (Remember that the PVID is only used internally within the Switch). Untagging is used to send packets from an 802.1Q-compliant network device to a non-compliant network device.

Frame Income Frame Leave	Income Frame is tagged	Income Frame is untagged
Leave port is tagged	Frame remains tagged	Tag is inserted
Leave port is untagged	Tag is removed	Frame remain untagged

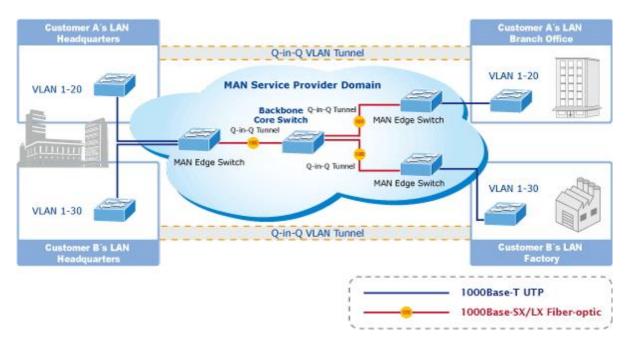

Table 4-3-3-1: Ingress / Egress Port with VLAN VID Tag / Untag Table

■ IEEE 802.1Q Tunneling (Q-in-Q)

IEEE 802.1Q Tunneling (Q-in-Q) is designed for service providers carrying traffic for multiple customers across their networks. Q-in-Q tunneling is used to maintain customer-specific VLAN and Layer 2 protocol configurations even when different customers use the same internal VLAN IDs. This is accomplished by inserting **Service Provider VLAN (SPVLAN)** tags into the customer's frames when they enter the service provider's network, and then stripping the tags when the frames leave the network.

A service provider's customers may have specific requirements for their internal VLAN IDs and number of VLANs supported. VLAN ranges required by different customers in the same service-provider network might easily overlap, and traffic passing through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations, require intensive processing of VLAN mapping tables, and could easily exceed the maximum VLAN limit of 4096.

The **Industrial Managed Switch** supports multiple VLAN tags and can therefore be used in MAN applications as a provider bridge, aggregating traffic from numerous independent customer LANs into the **MAN (Metro Access Network)** space. One of the purposes of the provider bridge is to recognize and use VLAN tags so that the VLANs in the MAN space can be used independent of the customers' VLANs. This is accomplished by adding a VLAN tag with a MAN-related VID for frames entering the MAN. When leaving the MAN, the tag is stripped and the original VLAN tag with the customer-related VID is again available.

This provides a tunneling mechanism to connect remote costumer VLANs through a common MAN space without interfering with the VLAN tags. All tags use EtherType **0x8100** or **0x88A8**, where 0x8100 is used for customer tags and 0x88A8 are used for service provider tags.

In cases where a given service VLAN only has two member ports on the switch, the learning can be disabled for the particular VLAN and can therefore rely on flooding as the forwarding mechanism between the two ports. This way, the MAC table requirements is reduced.

Global VLAN Configuration

The Global VLAN Configuration screen in Figure 4-3-3-1 appears.

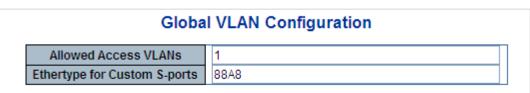

Figure 4-3-3-1: Global VLAN Configuration Screenshot

The page includes the following fields:

Object	Description			
Allowed Access	This field shows the allowed Access VLANs, it only affects ports configured as			
VLANs	Access ports. Ports in other modes are members of all VLANs specified in the			
	Allowed VLANs field.			
	By default, only VLAN 1 is enabled. More VLANs may be created by using a list			
	syntax where the individual elements are separated by commas. Ranges are			
	specified with a dash separating the lower and upper bound.			
	The following example will create VLANs 1, 10, 11, 12, 13, 200, and 300: 1,10-			
	13,200,300. Spaces are allowed in between the delimiters.			
Ethertype for Custom	This field specifies the ethertype/TPID (specified in hexadecimal) used for			
S-ports	Custom S-ports. The setting is in force for all ports whose Port Type is set to S-			
	Custom-Port.			

Port VLAN Configuration

The VLAN Port Configuration screen in Figure 4-3-3-2 appears.

Figure 4-3-3-2: Port VLAN Configuration Screenshot

The page includes the following fields:

Object		Description				
• Port		This is the logical port number for this row.				
• Mode	Access	Access ports are normally used to connect to end stations. Dynamic features like Voice VLAN may add the port to more VLANs behind the scenes. Access ports have the following characteristics:				
		 Member of exactly one VLAN, the Port VLAN (Access VLAN), which by default is 1 				
		Accepts untagged and C-tagged frames				
		Discards all frames that are not classified to the Access VLAN				
		On egress all frames classified to the Access VLAN are transmitted				
		untagged. Other (dynamically added VLANs) are transmitted tagged				
	Trunk	Trunk ports can carry traffic on multiple VLANs simultaneously, and are normally				
		used to connect to other switches. Trunk ports have the following characteristics:				
		By default, a trunk port is member of all VLANs (1-4095)				
		 The VLANs that a trunk port is member of may be limited by the use of Allowed VLANs 				
		 Frames classified to a VLAN that the port is not a member of are discarded 				
		By default, all frames but frames classified to the Port VLAN (a.k.a. Native VLAN) get tagged on egress. Frames classified to the Port VLAN do not get C-tagged on egress				
		 Egress tagging can be changed to tag all frames, in which case only tagged frames are accepted on ingress 				
	Hybrid	Hybrid ports resemble trunk ports in many ways, but adds additional port configuration features. In addition to the characteristics described for trunk ports,				
		hybrid ports have these abilities:				
		 Can be configured to be VLAN tag unaware, C-tag aware, S-tag aware, or S-custom-tag aware 				
		Ingress filtering can be controlled				
		Ingress acceptance of frames and configuration of egress tagging can				
		be configured independently				
Port VL	AN	Determines the port's VLAN ID (PVID). Allowed VLANs are in the range 1				
		through 4095, default being 1.				
		 On ingress, frames get classified to the Port VLAN if the port is configured 				
		as VLAN unaware, the frame is untagged, or VLAN awareness is enabled				
		on the port, but the frame is priority tagged (VLAN ID = 0).				
		■ On egress, frames classified to the Port VLAN do not get tagged if Egress				
		Tagging configuration is set to untag Port VLAN.				

	The Port VLAN is called an "Access VLAN" for ports in Access mode and
	Native VLAN for ports in Trunk or Hybrid mode.
Port Type	Ports in hybrid mode allow for changing the port type, that is, whether a frame's
• Fort Type	
	VLAN tag is used to classify the frame on ingress to a particular VLAN, and if so,
	which TPID it reacts on. Likewise, on egress, the Port Type determines the TPID
	of the tag, if a tag is required.
	Unaware:
	On ingress, all frames, whether carrying a VLAN tag or not, get classified
	to the Port VLAN, and possible tags are not removed on egress.
	C-Port:
	On ingress, frames with a VLAN tag with TPID = 0x8100 get classified to
	the VLAN ID embedded in the tag. If a frame is untagged or priority
	tagged, the frame gets classified to the Port VLAN. If frames must be
	tagged on egress, they will be tagged with a C-tag.
	S-Port:
	On ingress, frames with a VLAN tag with TPID = 0x8100 or 0x88A8 get
	classified to the VLAN ID embedded in the tag. If a frame is untagged or
	priority tagged, the frame gets classified to the Port VLAN. If frames must
	be tagged on egress, they will be tagged with an S-tag.
	S-Custom-Port:
	On ingress, frames with a VLAN tag with a TPID = 0x8100 or equal to the
	Ethertype configured for Custom-S ports get classified to the VLAN ID
	embedded in the tag. If a frame is untagged or priority tagged, the frame
	gets classified to the Port VLAN. If frames must be tagged on egress,
	they will be tagged with the custom S-tag.
Ingress Filtering	Hybrid ports allow for changing ingress filtering. Access and Trunk ports always
	have ingress filtering enabled.
	■ If ingress filtering is enabled (checkbox is checked), frames classified to a
	VLAN that the port is not a member of get discarded.
	■ If ingress filtering is disabled, frames classified to a VLAN that the port is
	not a member of are accepted and forwarded to the switch engine.
	However, the port will never transmit frames classified to VLANs that it is not a
	member of.
Ingress Acceptance	Hybrid ports allow for changing the type of frames that are accepted on ingress.
	Tagged and Untagged
	Both tagged and untagged frames are accepted.
	■ Tagged Only
	Only tagged frames are accepted on ingress. Untagged frames are
	discarded.
	■ Untagged Only

	Only 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1		
	Only untagged frames are accepted on ingress. Tagged frames are		
	discarded.		
Egress Tagging	This option is only available for ports in Hybrid mode. Ports in Trunk and Hybrid		
	mode may control the tagging of frames on egress.		
	Untag Port VLAN		
	Frames classified to the Port VLAN are transmitted untagged. Other		
	frames are transmitted with the relevant tag.		
	■ Tag All		
	All frames, whether classified to the Port VLAN or not, are transmitted		
	with a tag.		
	■ Untag All		
	All frames, whether classified to the Port VLAN or not, are transmitted		
	without a tag.		
Allowed VLANs	Ports in Trunk and Hybrid mode may control which VLANs they are allowed to		
	become members of. The field's syntax is identical to the syntax used in the		
	Enabled VLANs field.		
	By default, a Trunk or Hybrid port will become member of all VLANs, and is		
	therefore set to 1-4095. The field may be left empty, which means that the port		
	will not become member of any VLANs.		
Forbidden VLANs	A port may be configured to never be member of one or more VLANs. This is		
	particularly useful when dynamic VLAN protocols like MVRP and GVRP must be		
	prevented from dynamically adding ports to VLANs. The trick is to mark such		
	VLANs as forbidden on the port in question. The syntax is identical to the syntax		
	used in the Enabled VLANs field.		
	By default, the field is left blank, which means that the port may become a		
	member of all possible VLANs.		

The port must be a member of the same VLAN as the Port VLAN ID.

4.3.3.4 VLAN Membership Status

This page provides an overview of membership status for VLAN users. The VLAN Membership Status screen in Figure 4-3-3-3 appears.

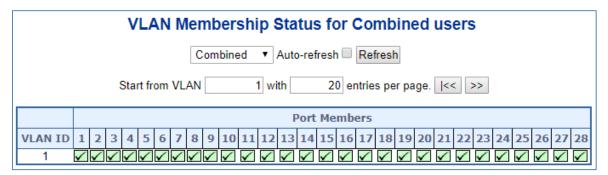

Figure 4-3-3-3: VLAN Membership Status for Static User Page Screenshot

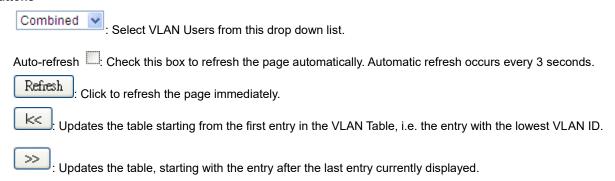

The page includes the following fields:

Object	Description	
 VLAN User 	A VLAN User is a module that uses services of the VLAN management	
	functionality to configure VLAN memberships and VLAN port configuration such	
	as PVID, UVID. Currently we support following VLAN :	
	- Admin : This is referred as static.	
	- NAS : NAS provides port-based authentication, which involves	
	communications between a Supplicant, Authenticator, and an Authentication	
	Server.	
	- GVRP : GVRP (GARP VLAN Registration Protocol or Generic VLAN	
	Registration Protocol) is a protocol that facilitates control of virtual local area	
	networks (VLANs) within a larger network .	
	- Voice VLAN : Voice VLAN is a VLAN configured specially for voice traffic	
	typically originating from IP phones.	
	- MVR : MVR is used to eliminate the need to duplicate multicast traffic for	
	subscribers in each VLAN. Multicast traffic for all channels is sent only on a	
	single (multicast) VLAN.	
• Port Members	A row of check boxes for each port is displayed for each VLAN ID.	
	If a port is included in a VLAN, an image will be displayed.	
	If a port is included in a Forbidden port list, an image 🗵 will be displayed.	
	If a port is included in a Forbidden port list and dynamic VLAN user register	
	VLAN on same Forbidden port, then conflict port will be displayed as conflict	
	port.	
VLAN Membership	The VLAN Membership Status page shall show the current VLAN port members	
	for all VLANs configured by a selected VLAN User (selection shall be allowed by	
	a Combo Box). When ALL VLAN Users are selected, it shall show this	

information for all the VLAN Users, and this is by default. VLAN membership allows the frames classified to the VLAN ID to be forwarded on the respective VLAN member ports.

Buttons

4.3.3.5 VLAN Port Status

This page provides VLAN Port Status. The VLAN Port Status screen in Figure 4-3-3-4 appears.

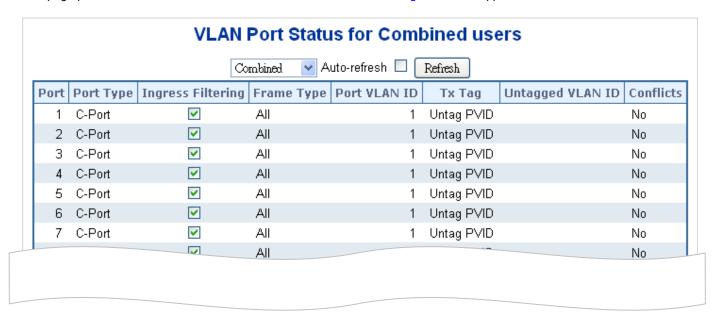

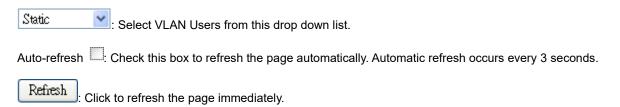

Figure 4-3-3-4: VLAN Port Status for Combined users Page Screenshot

The page includes the following fields:

Object	Description		
• Port	The logical port for the settings contained in the same row.		
• Port Type	Show the VLAN Awareness for the port.		
	If VLAN awareness is enabled, the tag is removed from tagged frames received		
	on the port. VLAN tagged frames are classified to the VLAN ID in the tag.		
	If VLAN awareness is disabled, all frames are classified to the Port VLAN ID and		
	tags are not removed.		
 Ingress Filtering 	Show the ingress filtering for a port. This parameter affects VLAN ingress		
	processing. If ingress filtering is enabled and the ingress port is not a member of		
	the classified VLAN of the frame, the frame is discarded.		
Frame Type	Shows whether the port accepts all frames or only tagged frames. This		
	parameter affects VLAN ingress processing. If the port only accepts tagged		
	frames, untagged frames received on that port are discarded.		
Port VLAN ID	Shows the PVID setting for the port.		
• Tx Tag	Shows egress filtering frame status whether tagged or untagged.		
Untagged VLAN ID	Shows UVID (untagged VLAN ID). Port's UVID determines the packet's behavior		
	at the egress side.		
• Conflicts	Shows status of Conflicts whether exists or Not. When a Volatile VLAN User		
	requests to set VLAN membership or VLAN port configuration, the following		
	conflicts can occur:		
	■ Functional Conflicts between feature.		
	■ Conflicts due to hardware limitation.		
	■ Direct conflict between user modules.		

Buttons

4.3.3.6 Private VLAN

The Private VLAN membership configurations for the switch can be monitored and modified here. Private VLANs can be added or deleted here. Port members of each Private VLAN can be added or removed here.

Private VLANs are based on the source port mask, and there are no connections to VLANs. This means that VLAN IDs and Private VLAN IDs can be identical.

A port must be a member of both a VLAN and a Private VLAN to be able to forward packets. By default, all ports are VLAN unaware and members of VLAN 1 and Private VLAN 1.

A VLAN unaware port can only be a member of one VLAN, but it can be a member of multiple Private VLANs. The VLAN Port Status screen in Figure 4-3-3-5 appears.

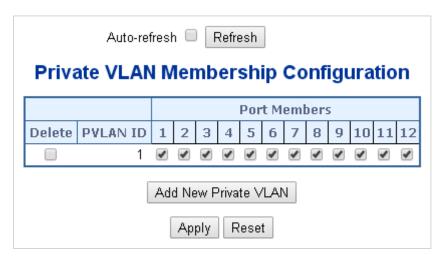

Figure 4-3-3-5: Private VLAN Membership Configuration page screenshot

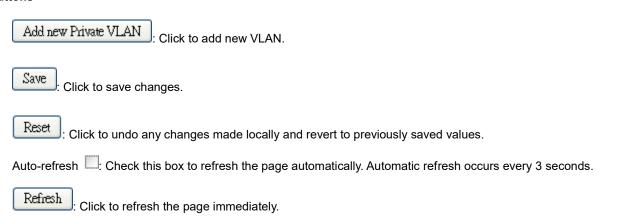

The page includes the following fields:

Object	Description	
• Delete	To delete a private VLAN entry, check this box. The entry will be deleted during	
	the next save.	
Private VLAN ID	Indicates the ID of this particular private VLAN.	
• Port Members	A row of check boxes for each port is displayed for each private VLAN ID. To	
	include a port in a Private VLAN, check the box. To remove or exclude the port	
	from the Private VLAN, make sure the box is unchecked. By default, no ports	
	are members, and all boxes are unchecked.	
Adding a New Private	Click "Add New Private VLAN" to add a new private VLAN ID. An empty row is	
VLAN	added to the table, and the private VLAN can be configured as needed. The	
	allowed range for a private VLAN ID is the same as the switch port number	
	range. Any values outside this range are not accepted, and a warning message	
	appears. Click "OK" to discard the incorrect entry, or click "Cancel" to return to	
	the editing and make a correction.	

The Private VLAN is enabled when you click "Save".
The "Delete" button can be used to undo the addition of new Private VLANs.

Buttons

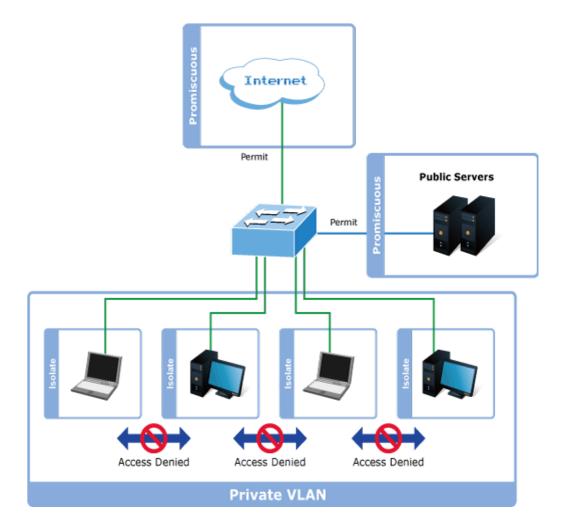

4.3.3.7 Port Isolation

Overview

When a VLAN is configured to be a private VLAN, communication between ports within that VLAN can be prevented. Two application examples are provided in this section:

- Customers connected to an ISP can be members of the same VLAN, but they are not allowed to communicate with each other within that VLAN.
- Servers in a farm of web servers in a Demilitarized Zone (DMZ) are allowed to communicate with the outside world and with database servers on the inside segment, but are not allowed to communicate with each other

For private VLANs to be applied, the switch must first be configured for standard VLAN operation When this is in place, one or more of the configured VLANs can be configured as private VLANs. Ports in a private VLAN fall into one of these two groups:

■ Promiscuous ports

- Ports from which traffic can be forwarded to all ports in the private VLAN
- Ports which can receive traffic from all ports in the private VLAN

Isolated ports

- Ports from which traffic can only be forwarded to promiscuous ports in the private VLAN
- Ports which can receive traffic from only promiscuous ports in the private VLAN

The configuration of promiscuous and isolated ports applies to all private VLANs. When traffic comes in on a promiscuous port in a private VLAN, the VLAN mask from the VLAN table is applied. When traffic comes in on an isolated port, the private VLAN mask is applied in addition to the VLAN mask from the VLAN table. This reduces the ports to which forwarding can be done to just the promiscuous ports within the private VLAN.

This page is used for enabling or disabling port isolation on ports in a Private VLAN. A port member of a VLAN can be isolated to other isolated ports on the same VLAN and Private VLAN. The Port Isolation screen in Figure 4-3-3-6 appears.

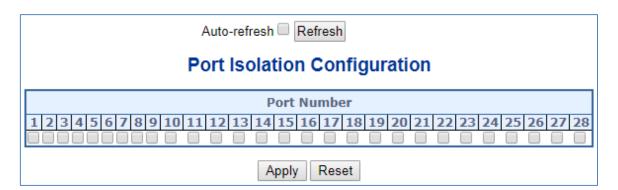

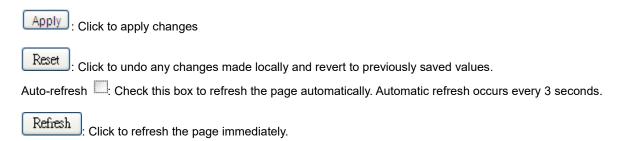

Figure 4-3-3-6: Port Isolation Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Port Members	A check box is provided for each port of a private VLAN. When checked, port
	isolation is enabled on that port. When unchecked, port isolation is disabled on
	that port.
	By default, port isolation is disabled on all ports.

Buttons

4.3.3.8 VLAN setting example:

- Separate VLAN
- 802.1Q VLAN Trunk
- Port Isolate

4.3.3.8.1 Two Separate 802.1Q VLANs

The diagram shows how the **Industrial Managed Switch** handle Tagged and Untagged traffic flow for two VLANs. VLAN Group 2 and VLAN Group 3 are separated VLAN. Each VLAN isolate network traffic so only members of the VLAN receive traffic from the same VLAN members. The screen in Figure 4-3-3-7 appears and Table 4-3-3-8 describes the port configuration of the **Industrial Managed Switch**es.

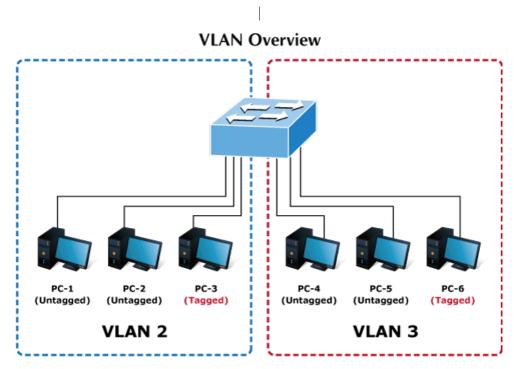

Figure 4-3-3-7: Two Separate VLANs Diagram

VLAN Group	VID	Untagged Members	Tagged Members
VLAN Group 1	1	Port-7 ~ Port-52	N/A
VLAN Group 2	2	Port-1,Port-2	Port-3
VLAN Group 3	3	Port-4,Port-5	Port-6

Table 4-1: VLAN and Port Configuration

The scenario is described as follows:

Untagged packet entering VLAN 2

- While [PC-1] transmit an untagged packet enters Port-1, the Industrial Managed Switch will tag it with a VLAN
 Tag=2. [PC-2] and [PC-3] will received the packet through Port-2 and Port-3.
- 2. [PC-4],[PC-5] and [PC-6] received no packet.
- 3. While the packet leaves Port-2, it will be stripped away it tag becoming an untagged packet.
- 4. While the packet leaves Port-3, it will keep as a tagged packet with VLAN Tag=2.
 - Tagged packet entering VLAN 2
- 5. While [PC-3] transmit a tagged packet with VLAN Tag=2 enters Port-3, [PC-1] and [PC-2] will received the packet through Port-1 and Port-2.
- 6. While the packet leaves Port-1 and Port-2, it will be stripped away it tag becoming an untagged packet.

Untagged packet entering VLAN 3

- While [PC-4] transmit an untagged packet enters Port-4, the switch will tag it with a VLAN Tag=3. [PC-5] and [PC-6] will received the packet through Port-5 and Port-6.
- 2. While the packet leaves Port-5, it will be stripped away it tag becoming an untagged packet.
- 3. While the packet leaves Port-6, it will keep as a tagged packet with VLAN Tag=3.

For this example, VLAN Group 1 just set as default VLAN, but only focus on VLAN 2 and VLAN 3 traffic flow

Setup steps

1. Add VLAN Group

Add two VLANs - VLAN 2 and VLAN 3

Type 1-3 in Allowed Access VLANs column, the 1-3 is including VLAN1 and 2 and 3.

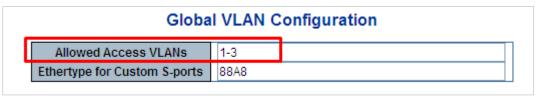

Figure 4-3-3-8: Add VLAN 2 and VLAN 3

2. Assign VLAN Member and PVID for each port:

VLAN 2 : Port-1,Port-2 and Port-3 VLAN 3 : Port-4, Port-5 and Port-6

VLAN 1 : All other ports - Port-7~Port-52

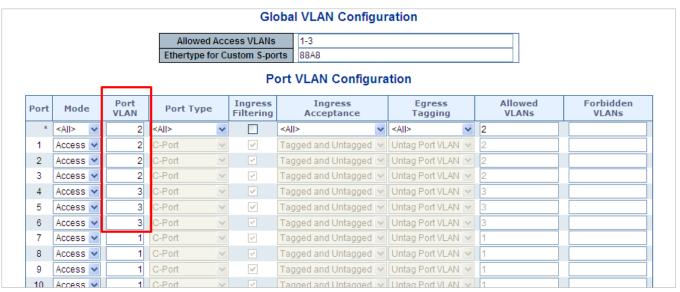

Figure 4-3-3-9: Change Port VLAN of Port 1~3 to be VLAN2 and Port VLAN of Port 4~6 to be VLAN3

3. Enable VLAN Tag for specific ports

Link Type: Port-3 (VLAN-2) and Port-6 (VLAN-3)

Change Port 3 Mode as Trunk, Selects Egress Tagging as Tag All and Types 2 in the Allowed VLANs column.

Change Port 6 Mode as Trunk and Selects Egress Tagging as Tag All and Types 3 in the Allowed VLANs column.

The Per Port VLAN configuration in Figure 4-3-3-10 appears.

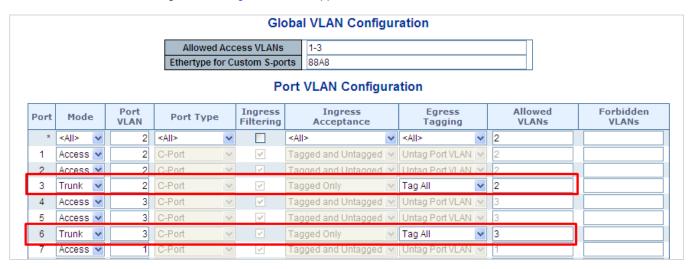

Figure 4-3-3-10: Check VLAN 2 and 3 Members on VLAN Membership Page

4.3.3.8.2 VLAN Trunking between two 802.1Q aware switches

The most cases are used for "**Uplink**" to other switches. VLANs are separated at different switches, but they need to access with other switches within the same VLAN group. The screen in Figure 4-3-3-11 appears.

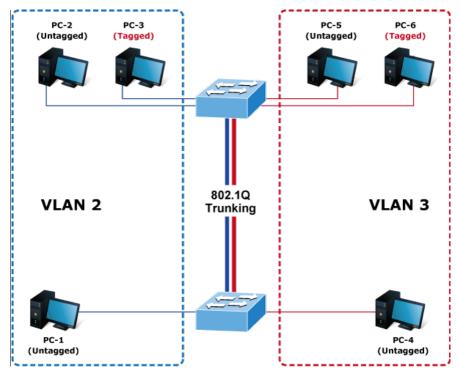

Figure 4-3-3-11: VLAN Trunking Diagram

Setup steps

1. Add VLAN Group

Add two VLANs - VLAN 2 and VLAN 3

Type 1-3 in Allowed Access VLANs column, the 1-3 is including VLAN1 and 2 and 3.

Figure 4-3-3-12: Add VLAN 2 and VLAN 3

2. Assign VLAN Member and PVID for each port :

VLAN 2 : Port-1,Port-2 and Port-3

VLAN 3: Port-4, Port-5 and Port-6

VLAN 1 : All other ports - Port-7~Port-52

Global VLAN Configuration Allowed Access VLANs Ethertype for Custom S-ports 88A8 Port VLAN Configuration Port Ingress Filtering Ingress Allowed Forbidden Port Mode Port Type VLANS Acceptance Tagging VLANS <All> <All> <All> 2 Untag All 2 C-Port Tagged and Untagged ▼ Access Tagged and Untagged ▼ Untag All 2 C-Port Access 3 2 C-Port Tagged and Untagged ▼ Untag All Access 4 2 Tagged and Untagged ▼ Untag All 4 Access C-Port 8 5 Access Tagged and Untagged 🔻 Tagged and Untagged ▼ C-Port 6 Access Untag All Tagged and Untagged ▼ Untag All Access ▼ C-Port ٧ 8 Access ▼ 2 C-Port 8 Tagged and Untagged ▼ Untag All 9 C-Port Tagged and Untagged ▼ Access ▼ Untag All C-Port 10 Access ▼ 2 Tagged and Untagged ▼ Untag All Apply Reset

Figure 4-3-3-13: Changes Port VLAN of Port 1~3 to be VLAN2 and Port VLAN of Port 4~6 to be VLAN3

For the VLAN ports connecting to the hosts, please refer to 4.6.10.1 examples. The following steps will focus on the VLAN **Trunk port** configuration.

- 1. Specify Port-7 to be the 802.1Q VLAN Trunk port.
- 2. Assign Port-7 to both VLAN 2 and VLAN 3 at the VLAN Member configuration page.
- 3. Define a VLAN 1 as a "Public Area" that overlapping with both VLAN 2 members and VLAN 3 members.
- Assign the VLAN Trunk Port to be the member of each VLAN which wants to be aggregated. For this example, add
 Port-7 to be VLAN 2 and VLAN 3 member port.
- 5. Specify **Port-7** to be the 802.1Q VLAN **Trunk port**, and the Trunking port must be a **Tagged** port while egress. The Port-7 configuration is shown in Figure 4-3-3-14.

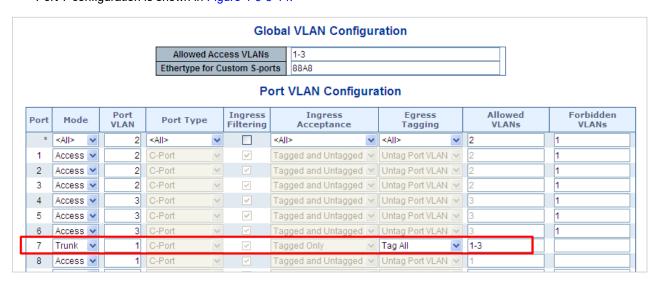

Figure 4-3-3-14: VLAN Overlap Port Setting & VLAN 1 - The Public Area Member Assign

That is, although the VLAN 2 members: Port-1 to Port-3 and VLAN 3 members: Port-4 to Port-6 also belongs to VLAN 1. But with different PVID settings, packets form VLAN 2 or VLAN 3 is not able to access to the other VLAN.

6. Repeat Steps 1 to 6, set up the VLAN Trunk port at the partner switch and add more VLANs to join the VLAN trunk, repeat Steps 1 to 3 to assign the Trunk port to the VLANs.

4.3.3.9 MAC-based VLAN

The MAC-based VLAN entries can be configured here. This page allows for adding and deleting MAC-based VLAN entries and assigning the entries to different ports. This page shows only static entries. The MAC-based VLAN screen in Figure 4-3-3-15 appears.

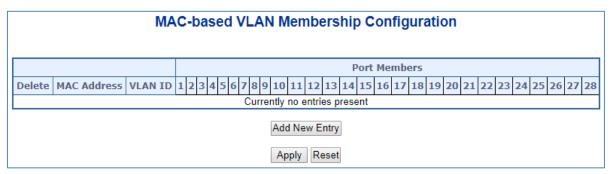

Figure 4-3-3-15: MAC-based VLAN Membership Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	To delete a MAC-based VLAN entry, check this box and press save.
MAC Address	Indicates the MAC address.
VLAN ID	Indicates the VLAN ID.
Port Members	A row of check boxes for each port is displayed for each MAC-based VLAN entry. To
	include a port in a MAC-based VLAN, check the box. To remove or exclude the port
	from the MAC-based VLAN, make sure the box is unchecked. By default, no ports
	are members, and all boxes are unchecked.
Adding a New	Click "Add New Entry" to add a new MAC-based VLAN entry. An empty row is
MAC-based VLAN	added to the table, and the MAC-based VLAN entry can be configured as needed.
	Any unicast MAC address can be configured for the MAC-based VLAN entry. No
	broadcast or multicast MAC addresses are allowed. Legal values for a VLAN ID are
	1 through 4095.
	The MAC-based VLAN entry is enabled when you click on "Save". A MAC-based
	VLAN without any port members will be deleted when you click "Save".
	The "Delete" button can be used to undo the addition of new MAC-based VLANs.

Buttons

Add New Entry: Click to add a new MAC-based VLAN entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Auto-refresh: Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

Click to refresh the page immediately.

Updates the table starting from the first entry in the MAC-based VLAN Table.

Updates the table, starting with the entry after the last entry currently displayed.

4.3.3.10 IP Subnet-based VLAN Membership Configuration

The IP subnet to VLAN ID mappings can be configured here. This page allows adding, updating and deleting IP subnet to VLAN ID mapping entries and assigning them to different ports. The MAC-based VLAN screen in Figure 4-3-3-16 appears.

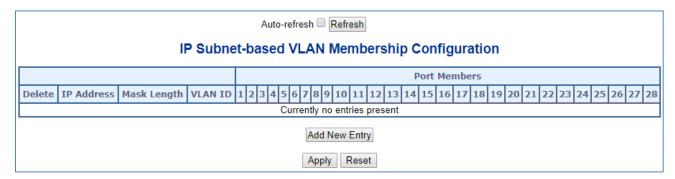

Figure 4-3-3-16: IP Subnet-based VLAN Membership Configuration page screenshot

The page includes the following fields:

Object	Description
• Delete	To delete a MAC-based VLAN entry, check this box and press save.
IP Address	Indicates the subnet's IP address (Any of the subnet's host addresses can be
	also provided here, the application will convert it automatically).
Mask Length	Indicates the subnet's mask length.
VLAN ID	Indicates the VLAN ID the subnet will be mapped to. IP Subnet to VLAN ID is a
	unique matching.
• Port Members	A row of check boxes for each port is displayed for each IP subnet to VLAN ID
	mapping entry. To include a port in a mapping, simply check the box. To remove
	or exclude the port from the mapping, make sure the box is unchecked. By
	default, no ports are members and all boxes are unchecked.
Adding a New IP	Click to add a new IP subnet to VLAN ID mapping entry. An empty row is added
subnet-based VLAN	to the table, and the mapping can be configured as needed. Any IP
	address/mask can be configured for the mapping. Legal values for the VLAN ID
	are 1 to 4095.
	The IP subnet to VLAN ID mapping entry is enabled when you click on "Apply".
	The delete button can be used to undo the addition of new mappings. The
	maximum possible IP subnet to VLAN ID mappings are limited to 128

Buttons

Reset: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Auto-refresh .: Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

4.3.3.11 Protocol-based VLAN

This page allows you to add new protocols to Group Name (unique for each Group) mapping entries as well as allow you to see and delete already mapped entries for the switch. The Protocol-based VLAN screen in Figure 4-3-3-17 appears.

Figure 4-3-3-17: Protocol to Group Mapping Table Page Screenshot

The page includes the following fields:

Object	Description	
• Delete	To delete a Protocol to Group Name map entry, check this box. The entry will be	
	deleted on the switch during the next Save.	
Frame Type	Frame Type can have one of the following values:	
	1. Ethernet	
	2. LLC	
	3. SNAP	
	Note: On changing the Frame type field, valid value of the following text field will	
	vary depending on the new frame type you selected.	
• Value	Valid value that can be entered in this text field depends on the option selected	
	from the preceding Frame Type selection menu.	
	Below is the criteria for three different Frame Types:	
	For Ethernet: Values in the text field when Ethernet is selected as a	
	Frame Type is called etype. Valid values for etype ranges from 0x0600-	
	0xffff	
	2. For LLC: Valid value in this case is comprised of two different sub-	
	values.	
	a. DSAP : 1-byte long string (0x00-0xff)	
	b. SSAP : 1-byte long string (0x00-0xff)	
	For SNAP: Valid value in this case also is comprised of two different	
	sub-values.	

	a.	OUI: OUI (Organizationally Unique Identifier) is value in format of	
	a.		
		xx-xx-xx where each pair (xx) in string is a hexadecimal value	
		ranges from 0x00-0xff.	
	b.	PID: If the OUI is hexadecimal 000000, the protocol ID is the	
		Ethernet type (EtherType) field value for the protocol running on	
		top of SNAP; if the OUI is an OUI for a particular organization, the	
		protocol ID is a value assigned by that organization to the protocol	
		running on top of SNAP.	
	In other words, if value of OUI field is 00-00-00 then value of PID will be		
	etype (0	0x0600-0xffff) and if value of OUI is other than 00-00-00 then valid	
	value of	f PID will be any value from 0x0000 to 0xffff.	
Group Name	A valid Group Name is a unique 16-character long string for every entry which		
	consists of a combination of alphabets (a-z or A-Z) and integers(0-9).		
	Note: specia	al character and underscore(_) are not allowed.	
Adding a New Group	Click "Add New Entry" to add a new entry in mapping table. An empty row is		
to VLAN mapping	added to the table; Frame Type, Value and the Group Name can be configured		
entry	as needed.		
	The "Delete" button can be used to undo the addition of new entry.		

Buttons

Add New Entry: Click to add a new entry in mapping table.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Auto-refresh: Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

4.3.3.12 Protocol-based VLAN Membership

This page allows you to map a already configured Group Name to a VLAN for the switch. The Group Name to VLAN Mapping Table screen in Figure 4-6-18 appears.

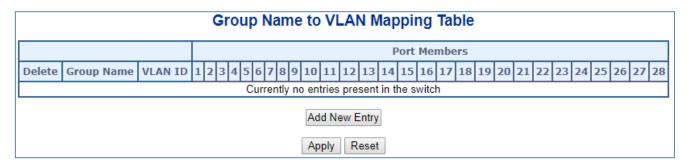

Figure 4-3-3-18: Group Name to VLAN Mapping Table Page Screenshot

The page includes the following fields:

Object	Description	
• Delete	To delete a Group Name to VLAN map entry, check this box. The entry will be	
	deleted on the switch during the next Save	
Group Name	A valid Group Name is a string of almost 16 characters which consists of a	
	combination of alphabets (a-z or A-Z) and integers(0-9), no special character is	
	allowed. Whichever Group name you try map to a VLAN must be present in	
	Protocol to Group mapping table and must not be preused by any other existing	
	mapping entry on this page.	
VLAN ID	Indicates the ID to which Group Name will be mapped. A valid VLAN ID ranges	
	from 1-4095.	
• Port Members	A row of check boxes for each port is displayed for each Group Name to VLAN	
	ID mapping. To include a port in a mapping, check the box. To remove or	
	exclude the port from the mapping, make sure the box is unchecked. By default,	
	no ports are members, and all boxes are unchecked.	
Adding a New Group	Click "Add New Entry" to add a new entry in mapping table. An empty row is	
to VLAN mapping	added to the table, the Group Name, VLAN ID and port members can be	
entry	configured as needed. Legal values for a VLAN ID are 1 through 4095.	
	The "Delete" button can be used to undo the addition of new entry.	

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Auto-refresh: Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

4.3.3.13 SVL (Only applies to switches installed with firmware v1.2112bxxxxxx)

SVL stands for Shared VLAN Learning. In SVL, one or more VLANs map to a Filter ID (FID). By default, there is a one-to-one mapping from VLAN to FID, in which case the switch acts as an IVL bridge, but with SVL multiple VLANs may share the same MAC address table entries.

Shared VLAN Learning Configuration

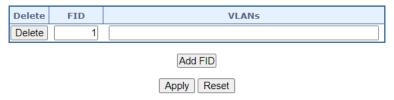

Figure 4-3-3-19: Shared VLAN Learning Configuration

The page includes the following fields:

Object	Description		
• Delete	A previously allocated FID can be deleted by the use of this button.		
• FID	The Filter ID (FID) is the ID that VLANs get learned on in the MAC table when		
	SVL is in effect.		
	No two rows in the table can have the same FID and the FID must be a number		
	between 1 and 4095.		
• VLANs	List of VLANs mapped into FID.		
	The syntax is as follows: Individual VLANs are separated by commas. Ranges		
	are specified with a dash separating the lower and upper bound.		
	The following example will map VLANs 1, 10, 11, 12, 13, 200, and 300: 1,10-		
	13,200,300. Spaces are allowed in between the delimiters. The range of valid		
	VLANs is 1 to 4095.		
	The same VLAN can only be a member of one FID. A message will be displayed		
	if one VLAN is grouped into two or more FIDs.		
	All VLANs must map to a particular FID, and by default VLAN x maps to FID x.		
	This implies that if FID x is defined, then VLAN x is implicitly a member of FID x		
	unless it is specified for another FID. If FID x doesn't exist, a confirmation		
	message will be displayed, asking whether to continue adding VLAN x implicitly		
	to FID x.		

Buttons

Add FID : Add a new row to the SVL table. The FID will be pre-filled with the first unused FID.

Apply : Click to apply changes

Reset :: Click to undo any changes made locally and revert to previously saved values.

4.3.3.14 VLAN Translation (Only applies to switches installed with firmware v1.2112bxxxxxx)

VLAN Mapping is a mechanism that maps a Customer's VLAN to a service provider's VLAN (Translated-VLAN). When packets are received on a port, they are mapped to a Translated VLAN based on the port ID and customer VLAN ID of the packets.

4.3.3.14.1 Port to Group Configuration

This page allows you to configure switch Ports to use a given VLAN Translation Mapping Group. This will enable all VLAN Translation mappings of that group (if any) on the selected switch port.

Port	Group Configuration		
Port	Default	Group ID	
*		<> ∨	
1		1 🕶	
2		3 🕶	
3		3 🕶	
4		4 🗸	
5		5 🕶	
6		6 🗸	
7		7 🕶	
8		8 🕶	
9		9 🕶	
10		10 🕶	
11		11 🕶	
12		12 🕶	
13		13 🕶	
14		14 🕶	
15		15 🕶	

Figure 4-3-3-20: VLAN Translation Port Configuration

The displayed settings are:

Object	Description	
Object		
• Port	The Port column shows the list of ports for which you can configure the VLAN	
	Translation Mapping Group.	
• Default	To set the switch port to use the default VLAN Translation Group click the	
	checkbox and press Save.	
Group ID	The VLAN Translation mappings are organized into Groups, identified by the	
	Group ID. This way a port is configured to use a number of VLAN Translation	
	mappings easily by simply configuring it to use a given group. Then number of	
	possible groups in a switch is equal to the number of ports present in this switch.	
	A port can be configured to use any of the groups, but only one at any given	
	time. Multiple ports can be configured to use the same group. A valid Group ID is	
	an integer value from 1 to 28.	
	Note: By default, each port is set to use the group with Group ID equal to the	
	port number. For example, port #1 is by default set to use group with GID = 1.	

Buttons

Refresh : Click to refresh the page immediately.

Apply : Click to apply changes.

Reset : Click to undo any changes made locally and revert to the previously saved values.

4.3.3.14.2 VLAN Translation Mappings

This page allows you to create mappings of VLANs -> Translated VLANs and organize these mappings into global Groups.

Mapping Parameters

Figure 4-3-3-21: VLAN Translation Mapping Table Configuration

Object	Description		
Group ID	The VLAN Translation mappings are organized into Groups, identified by the		
	Group ID. This way a port is configured to use a number of VLAN Translation		
	mappings easily by simply configuring it to use a given group. Then number of		
	possible groups in a switch is equal to the number of ports present in this switch.		
	A port can be configured to use any of the groups, but only one at any given		
	time. Multiple ports can be configured to use the same group. A valid Group ID is		
	an integer value from 1 to 28.		
	Note: By default, each port is set to use the group with Group ID equal to the		
	port number. For example, port #1 is by default set to use group with GID = 1.		
• Direction	Indicates the direction of the VLAN Translation and it refers to the switch. The		
	direction can be 'Ingress', where the translation takes place on the VLAN ID of		
	frames entering the switch port, 'Egress', where the translation takes place on		
	the VLAN ID of frames exiting the switch port, or 'Both', where the translation		
	takes place on both of the above directions.		
• VID	Indicates the VLAN ID of the mapping (i.e. 'source' VLAN). A valid VLAN ID		
	ranges from 1 to 4095.		
• TVID	Indicates the translated VLAN ID to which a VLAN ID of a frame will be		
	translated to. A valid translated VLAN ID ranges from 1 to 4095.		

Buttons

Apply: Click to refresh the page immediately.

Reset : Click to undo any changes made locally and revert to previously saved values.

Cancel: Return to the previous page; any changes made locally will be undone.

4.3.3.15 GVRP (Only applies to switches installed with firmware v1.2112bxxxxxx)

GVRP (GARP VLAN Registration Protocol or Generic VLAN Registration Protocol) is a protocol that facilitates control of virtual local area networks (VLANs) within a larger network

4.3.3.15.1 GVRP Configuration

This page allows you to configure the global GVRP configuration settings that are commonly applied to all GVRP enabled ports. as well. as screen in Figure 4-3-3-22 appears.

Figure 4-3-3-22: GVRP Configuration Page Screenshot

The page includes the following fields:

General Settings

Object	Description	
Enable GVRP globally	The GVRP feature is globally enabled by setting the check mark in the checkbox	
	named Enable GVRP and pressing the Save button.	
GVRP protocol timers	Join-time is a value in the range of 1-20cs, i.e. in units of one hundredth of a	
	second. The default value is 20cs.	
	Leave-time is a value in the range of 60-300cs, i.e. in units of one hundredth of a	
	second.	
	The default is 60cs.	
	LeaveAll-time is a value in the range of 1000-5000cs, i.e. in units of one	
	hundredth of a second.	
	The default is 1000cs	
Max number of VLANs	When GVRP is enabled, a maximum number of VLANs supported by GVRP is	
	specified. By default this number is 20. This number can only be changed when	
	GVRP is turned off.	

Buttons

Refresh: Click to refresh the page. Note that unsaved changes will be lost.

Reset : Click to undo any changes made locally and revert to previously saved values.

4.3.3.15.2 GVRP Port Configuration

This configuration can be performed either before or after GVRP is configured globally - the protocol operation will be the same. as well. as screen in Figure 4-3-3-23 appears.

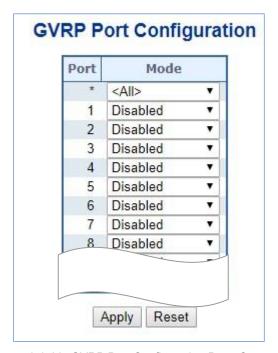

Figure 4-3-3-23: GVRP Port Configuration Page Screenshot

The page includes the following fields:

General Settings

Object	Description	
• Port	The logical port that is to be configured.	
• Mode	Mode can be either 'Disabled' or 'GVRP enabled'. These values turn the GVRP	
	feature off or on respectively for the port in question.

4.3.3.16 MRP (Only applies to switches installed with firmware v1.2112bxxxxxx)

4.3.3.16.1 Port Configuration

This page allows you to configure the MRP generic settings for all switch ports.

Auto-refresh Refresh

MRP Overall Port Configuration

Port	Join Timeout	Leave Timeout	LeaveAll Timeout	Periodic Transmission
*	20	60	1000	
1	20	60	1000	
2	20	60	1000	
3	20	60	1000	
4	20	60	1000	
5	20	60	1000	
6	20	60	1000	

Apply Reset

Figure 4-3-3-24: MRP Overall Port Configuration

The Table below shows the settings can be made on this page.

Object	Description	
• Port	The port number for which the following configuration applies.	
Join Timeout	Controls the timeout of the Join Timer for all MRP Applications on this switch	
	port. This value is restricted to 1-20 centiseconds.	
Leave Timeout	Controls the timeout of the Leave Timer for all MRP Applications on this switch	
	port. This value is restricted to 60- 300 centiseconds.	
LeaveAll Timeout	Controls the timeout of the LeaveAll Timer for all MRP Applications on this	
	switch port. This value is restricted to 1000- 5000 centiseconds.	
Periodic Transmission	Enable or disable the PeriodicTransmission feature for all MRP Applications on	
	this switch port.	

4.3.3.16.2 MVRP Global Configuration

This page allows you to configure the MVRP global and per port settings altogether. The page is divided into a global section and a per-port configuration section.

Auto-refresh Refresh

MVRP Port Configuration

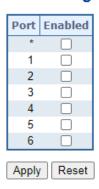

Figure 4-3-3-25: MVRP Global Configuration

The following table shows the adjustable settings on this page.

Object	Description	
Global State	Enable or disable the MVRP protocol globally. This will enable or disable the	
	protocol globally and at the same time on the switch ports that are MVRP	
	enabled.	
Managed VLANs	This field shows the managed VLANs, i.e. the VLANs that MVRP will operate	
	upon. By default, only VLANs 1- 4094 are managed, i.e. the entire range as	
	defined in IEEE802.1Q-2014 for MVRP. However this range can be limited by	
	using a list syntax where the individual elements are separated by commas.	
	Ranges are specified with a dash separating the lower and upper bound.	
	The following example will create VLANs 1, 10, 11, 12, 13, 200, and 300: 1,10-	
	13,200,300. Spaces are allowed in between the delimiters.	
• Port	The port number for which the following configuration applies.	
• Enabled	Enable or disable the MVRP protocol on this switch port. This will enable or	
	disable the protocol on the switch port given that MVRP is also globally enabled.	

4.3.3.16.3 MVRP Statistics

This page provides statistics for the MVRP protocol for all switch ports.

MVRP Statistics

Auto-refresh Refresh

Port	Failed Registrations	Last PDU Origin
1	0	00-00-00-00-00
2	0	00-00-00-00-00
3	0	00-00-00-00-00
4	0	00-00-00-00-00
5	0	00-00-00-00-00
6	0	00-00-00-00-00

Figure 4-3-3-26: MVRP Statistics

The following table explains the information shown on this page.

Object	Description	
• Port	The logical port for the statistics contained in the same row.	
Failed Registrations	The number of failed VLAN registrations on this switch port. Each port	
	implementing the MVRP protocol maintains a count of the number of times it has	
	received a VLAN registration request but has failed to register the VLAN due to	
	lack of space in the Filtering Database.	
Last PDU Origin	The MAC address of the most recent MVRP PDU received on this switch port.	
	MAC is 00-00-00-00-00 if the protocol is not enabled on that switch port, or if	
	the port has not received any MVRP PDUs yet.	

4.3.4 Spanning Tree Protocol

4.3.4.1 Theory

The Spanning Tree protocol can be used to detect and disable network loops, and to provide backup links between switches, bridges or routers. This allows the switch to interact with other bridging devices in your network to ensure that only one route exists between any two stations on the network, and provide backup links which automatically take over when a primary link goes down. The spanning tree algorithms supported by this switch include these versions:

- STP Spanning Tree Protocol (IEEE 802.1D)
- RSTP Rapid Spanning Tree Protocol (IEEE 802.1w)
- MSTP Multiple Spanning Tree Protocol (IEEE 802.1s)

The IEEE 802.1D Spanning Tree Protocol and IEEE 802.1w Rapid Spanning Tree Protocol allow for the blocking of links between switches that form loops within the network. When multiple links between switches are detected, a primary link is established. Duplicated links are blocked from use and become standby links. The protocol allows for the duplicate links to be used in the event of a failure of the primary link. Once the Spanning Tree Protocol is configured and enabled, primary links are established and duplicated links are blocked automatically. The reactivation of the blocked links (at the time of a primary link failure) is also accomplished automatically without operator intervention.

This automatic network reconfiguration provides maximum uptime to network users. However, the concepts of the Spanning Tree Algorithm and protocol are a complicated and complex subject and must be fully researched and understood. It is possible to cause serious degradation of the performance of the network if the Spanning Tree is incorrectly configured. Please read the following before making any changes from the default values.

The Switch STP performs the following functions:

- Creates a single spanning tree from any combination of switching or bridging elements.
- Creates multiple spanning trees from any combination of ports contained within a single switch, in user specified groups.
- Automatically reconfigures the spanning tree to compensate for the failure, addition, or removal of any element in the tree.
- Reconfigures the spanning tree without operator intervention.

Bridge Protocol Data Units

For STP to arrive at a stable network topology, the following information is used:

- The unique switch identifier
- The path cost to the root associated with each switch port
- The port identifier

STP communicates between switches on the network using Bridge Protocol Data Units (BPDUs). Each BPDU contains the following information:

- The unique identifier of the switch that the transmitting switch currently believes is the root switch
- The path cost to the root from the transmitting port
- The port identifier of the transmitting port

The switch sends BPDUs to communicate and construct the spanning-tree topology. All switches connected to the LAN on which the packet is transmitted will receive the BPDU. BPDUs are not directly forwarded by the switch, but the receiving switch uses the information in the frame to calculate a BPDU, and, if the topology changes, initiates a BPDU transmission.

The communication between switches via BPDUs results in the following:

- One switch is elected as the root switch
- The shortest distance to the root switch is calculated for each switch
- A designated switch is selected. This is the switch closest to the root switch through which packets will be forwarded to the root.
- A port for each switch is selected. This is the port providing the best path from the switch to the root switch.
- Ports included in the STP are selected.

Creating a Stable STP Topology

It is to make the root port a fastest link. If all switches have STP enabled with default settings, the switch with the lowest MAC address in the network will become the root switch. By increasing the priority (lowering the priority number) of the best switch, STP can be forced to select the best switch as the root switch.

When STP is enabled using the default parameters, the path between source and destination stations in a switched network might not be ideal. For instance, connecting higher-speed links to a port that has a higher number than the current root port can cause a root-port change.

STP Port States

The BPDUs take some time to pass through a network. This propagation delay can result in topology changes where a port that transitioned directly from a Blocking state to a Forwarding state could create temporary data loops. Ports must wait for new network topology information to propagate throughout the network before starting to forward packets. They must also wait for the packet lifetime to expire for BPDU packets that were forwarded based on the old topology. The forward delay timer is used to allow the network topology to stabilize after a topology change. In addition, STP specifies a series of states a port must transition through to further ensure that a stable network topology is created after a topology change.

Each port on a switch using STP exists is in one of the following five states:

- Blocking the port is blocked from forwarding or receiving packets
- Listening the port is waiting to receive BPDU packets that may tell the port to go back to the blocking state
- Learning the port is adding addresses to its forwarding database, but not yet forwarding packets
- Forwarding the port is forwarding packets
- **Disabled** the port only responds to network management messages and must return to the blocking state first

A port transitions from one state to another as follows:

- From initialization (switch boot) to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled
- From disabled to blocking

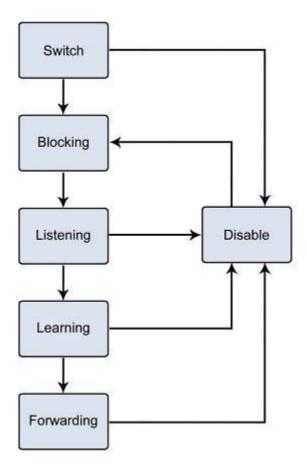

Figure 4-3-4-1: STP Port State Transitions

You can modify each port state by using management software. When you enable STP, every port on every switch in the network goes through the blocking state and then transitions through the states of listening and learning at power up. If properly configured, each port stabilizes to the forwarding or blocking state. No packets (except BPDUs) are forwarded from, or received by, STP enabled ports until the forwarding state is enabled for that port.

2. STP Parameters

STP Operation Levels

The Switch allows for two levels of operation: the switch level and the port level. The switch level forms a spanning tree consisting of links between one or more switches. The port level constructs a spanning tree consisting of groups of one or more ports. The STP operates in much the same way for both levels.

On the switch level, STP calculates the Bridge Identifier for each switch and then sets the Root Bridge and the Designated Bridges.

On the port level, STP sets the Root Port and the Designated Ports.

The following are the user-configurable STP parameters for the switch level: $\begin{tabular}{ll} \hline \end{tabular}$

Parameter	Description	Default Value
Bridge Identifier(Not user	A combination of the User-set priority and	32768 + MAC
configurable	the switch's MAC address.	
except by setting priority	The Bridge Identifier consists of two parts:	
below)	a 16-bit priority and a 48-bit Ethernet MAC	
	address 32768 + MAC	
Priority	A relative priority for each switch – lower	32768
	numbers give a higher priority and a greater	
	chance of a given switch being elected as	
	the root bridge	
Hello Time	The length of time between broadcasts of	2 seconds
	the hello message by the switch	
Maximum Age Timer	Measures the age of a received BPDU for a	20 seconds
	port and ensures that the BPDU is	
	discarded when its age exceeds the value	
	of the maximum age timer.	
Forward Delay Timer	The amount time spent by a port in the	15 seconds
	learning and listening states waiting for a	
	BPDU that may return the port to the	
	blocking state.	

The following are the user-configurable STP parameters for the port or port group level:

Variable	Description	Default Value
Port Priority	A relative priority for each	128
	port –lower numbers give a higher priority	
	and a greater chance of a given port being	
	elected as the root port	
Port Cost	A value used by STP to evaluate paths –	200,000-100Mbps Fast Ethernet ports
	STP calculates path costs and selects the	20,000-1000Mbps Gigabit Ethernet
	path with the minimum cost as the active	ports
	path	0 - Auto

Default Spanning-Tree Configuration

Feature	Default Value
Enable state	STP disabled for all ports
Port priority	128
Port cost	0
Bridge Priority	32,768

User-Changeable STA Parameters

The Switch's factory default setting should cover the majority of installations. However, it is advisable to keep the default settings as set at the factory; unless, it is absolutely necessary. The user changeable parameters in the Switch are as follows: **Priority** – A Priority for the switch can be set from 0 to 65535. 0 is equal to the highest Priority.

Hello Time – The Hello Time can be from 1 to 10 seconds. This is the interval between two transmissions of BPDU packets sent by the Root Bridge to tell all other Switches that it is indeed the Root Bridge. If you set a Hello Time for your Switch, and it is not the Root Bridge, the set Hello Time will be used if and when your Switch becomes the Root Bridge.

The Hello Time cannot be longer than the Max. Age; otherwise, a configuration error will occur.

Max. Age – The Max Age can be from 6 to 40 seconds. At the end of the Max Age, if a BPDU has still not been received from the Root Bridge, your Switch will start sending its own BPDU to all other Switches for permission to become the Root Bridge. If it turns out that your Switch has the lowest Bridge Identifier, it will become the Root Bridge.

Forward Delay Timer - The Forward Delay can be from 4 to 30 seconds. This is the time any port on the

Switch spends in the listening state while moving from the blocking state to the forwarding state.

Observe the following formulas when setting the above parameters:

Max. Age _ 2 x (Forward Delay - 1 second)

Max. Age _ 2 x (Hello Time + 1 second)

Port Priority – A Port Priority can be from 0 to 240. The lower the number, the greater the probability the port will be chosen as the Root Port.

Port Cost – A Port Cost can be set from 0 to 200000000. The lower the number, the greater the probability the port will be chosen to forward packets.

3. Illustration of STP

A simple illustration of three switches connected in a loop is depicted in the below diagram. In this example, you can anticipate some major network problems if the STP assistance is not applied.

If switch A broadcasts a packet to switch B, switch B will broadcast it to switch C, and switch C will broadcast it to back to switch A and so on. The broadcast packet will be passed indefinitely in a loop, potentially causing a network failure. In this example, STP breaks the loop by blocking the connection between switch B and C. The decision to block a particular connection is based on the STP calculation of the most current Bridge and Port settings.

Now, if switch A broadcasts a packet to switch C, then switch C will drop the packet at port 2 and the broadcast will end there. Setting-up STP using values other than the defaults, can be complex. Therefore, you are advised to keep the default factory settings and STP will automatically assign root bridges/ports and block loop connections. Influencing STP to choose a particular switch as the root bridge using the Priority setting, or influencing STP to choose a particular port to block using the Port Priority and Port Cost settings is, however, relatively straight forward.

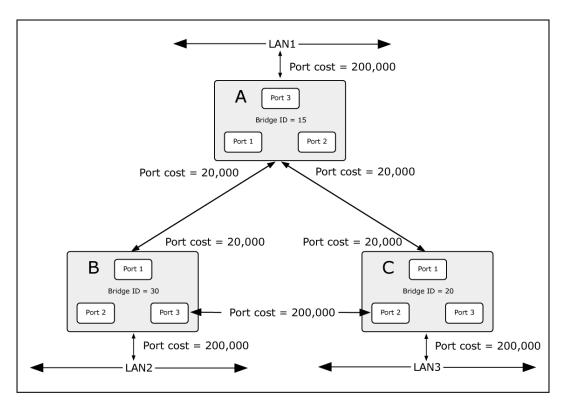

Figure 4-3-4-2: Before Applying the STA Rules

In this example, only the default STP values are used.

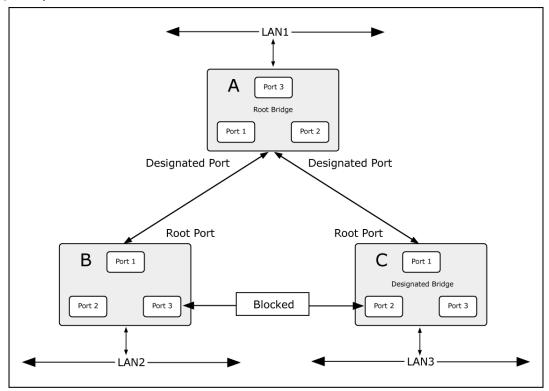

Figure 4-3-4-3: After Applying the STA Rules

The switch with the lowest Bridge ID (switch C) was elected the root bridge, and the ports were selected to give a high port cost between switches B and C. The two (optional) Gigabit ports (default port cost = 20,000) on switch A are connected to one (optional) Gigabit port on both switch B and C. The redundant link between switch B and C is deliberately chosen as a 100 Mbps Fast Ethernet link (default port cost = 200,000). Gigabit ports could be used, but the port cost should be increased from the default to ensure that the link between switch B and switch C is the blocked link.

4.3.4.2 STP System Configuration

This page allows you to configure STP system settings. The settings are used by all STP Bridge instances in the Switch. The **Industrial Managed Switch** support the following Spanning Tree protocols:

- **Compatiable -- Spanning Tree Protocol (STP):**Provides a single path between end stations, avoiding and eliminating loops.
- Normal -- Rapid Spanning Tree Protocol (RSTP): Detects and uses of network topologies that provide faster spanning tree convergence, without creating forwarding loops.
- Extension Multiple Spanning Tree Protocol (MSTP): Defines an extension to RSTP to further develop the
 usefulness of virtual LANs (VLANs). This "Per-VLAN" Multiple Spanning Tree Protocol configures a separate
 Spanning Tree for each VLAN group and blocks all but one of the possible alternate paths within each Spanning
 Tree.

The STP System Configuration screen in Figure 4-3-4-4 appears.

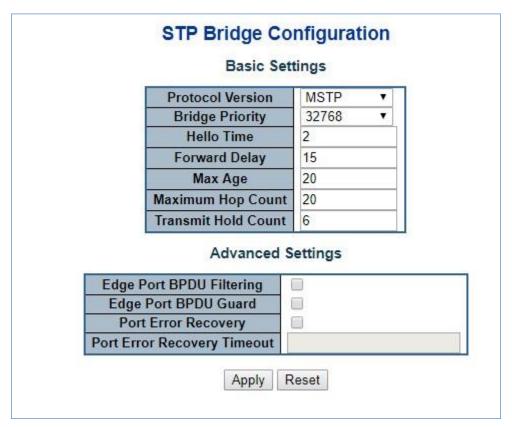

Figure 4-3-4-4: STP Bridge Configuration Page Screenshot

The page includes the following fields:

Basic Settings

Object	Description
Protocol Version	The STP protocol version setting. Valid values are:
	■ STP (IEEE 802.1D Spanning Tree Protocol)
	■ RSTP (IEEE 802.2w Rapid Spanning Tree Protocol)
	■ MSTP (IEEE 802.1s Multiple Spanning Tree Protocol)
Bridge Priority	Controls the bridge priority. Lower numeric values have better priority. The
	bridge priority plus the MSTI instance number, concatenated with the 6-byte
	MAC address of the switch forms a Bridge Identifier.
	For MSTP operation, this is the priority of the CIST. Otherwise, this is the priority
	of the STP/RSTP bridge.
Hello Time	The interval between sending STP BPDU's. Valid values are in the range 1 to 10
	seconds, default is 2 seconds
Forward Delay	The delay used by STP Bridges to transition Root and Designated Ports to
	Forwarding (used in STP compatible mode). Valid values are in the range 4 to
	30 seconds
	-Default: 15
	-Minimum: The higher of 4 or [(Max. Message Age / 2) + 1]
	-Maximum: 30
Max Age	The maximum age of the information transmitted by the Bridge when it is the
	Root Bridge. Valid values are in the range 6 to 40 seconds.
	-Default: 20
	-Minimum: The higher of 6 or [2 x (Hello Time + 1)].
	-Maximum: The lower of 40 or [2 x (Forward Delay -1)]
Maximum Hop Count	This defines the initial value of remaining Hops for MSTI information generated
	at the boundary of an MSTI region. It defines how many bridges a root bridge
	can distribute its BPDU information. Valid values are in the range 6 to 40 hops.
• Transmit Hold Count	The number of BPDU's a bridge port can send per second. When exceeded,
	transmission of the next BPDU will be delayed. Valid values are in the range 1 to
	10 BPDU's per second.

Advanced Settings

Object	Description
Edge Port BPDU	Control whether a port explicitly configured as Edge will transmit and receive
Filtering	BPDUs.
Edge Port BPDU	Control whether a port explicitly configured as Edge will disable itself upon
Guard	reception of a BPDU. The port will enter the error-disabled state, and will be
	removed from the active topology.
Port Error Recovery	Control whether a port in the error-disabled state automatically will be enabled
	after a certain time. If recovery is not enabled, ports have to be disabled and re-
	enabled for normal STP operation. The condition is also cleared by a system
	reboot.
Port Error Recovery	The time that has to pass before a port in the error-disabled state can be
Timeout	enabled. Valid values are between 30 and 86400 seconds (24 hours).

The **Industrial Managed Switch** implements the Rapid Spanning Protocol as the default spanning tree protocol. When selecting "**Compatibles**" mode, the system uses the RSTP (802.1w) to be compatible and to co-work with another STP (802.1D)'s BPDU control packet.

4.3.4.3 Bridge Status

This page provides a status overview for all STP bridge instances. The displayed table contains a row for each STP bridge instance, where the column displays the following information: The Bridge Status screen in Figure 4-3-4-5 appears.

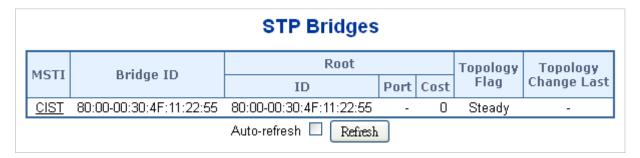

Figure 4-3-4-5: STP Bridge Status Page Screenshot

The page includes the following fields:

Object	Description
• MSTI	The Bridge Instance. This is also a link to the STP Detailed Bridge Status.
Bridge ID	The Bridge ID of this Bridge instance.
Root ID	The Bridge ID of the currently elected root bridge.
Root Port	The switch port currently assigned the <i>root</i> port role.
Root Cost	Root Path Cost. For the Root Bridge this is zero. For all other Bridges, it is the sum of the Port Path Costs on the least cost path to the Root Bridge.
Topology Flag	The current state of the Topology Change Flag for this Bridge instance.
Topology Change Last	The time since last Topology Change occurred.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

4.3.4.4 CIST Port Configuration

This page allows the user to inspect the current STP CIST port configurations, and possibly change them as well. The CIST Port Configuration screen in Figure 4-3-4-6 appears.

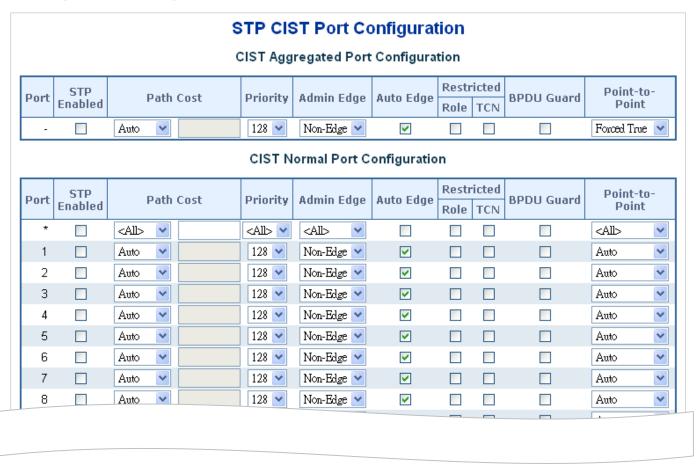

Figure 4-3-4-6: STP CIST Port Configuration Page Screenshot

The page includes the following fields:

Object	Description	
• Port	The switch port number of the logical STP port.	
STP Enabled	Controls whether RSTP is enabled on this switch port.	
Path Cost	Controls the path cost incurred by the port. The Auto setting will set the path	
	cost as appropriate by the physical link speed, using the 802.1D recommended	
	values. Using the Specific setting, a user-defined value can be entered. The	
	path cost is used when establishing the active topology of the network. Lower	
	path cost ports are chosen as forwarding ports in favor of higher path cost ports.	
	Valid values are in the range 1 to 200000000.	
• Priority	Controls the port priority. This can be used to control priority of ports having	
	identical port cost. (See above).	
	Default: 128	
	Range: 0-240, in steps of 16	
AdminEdge	Controls whether the operEdge flag should start as being set or cleared. (The	
	initial operEdge state when a port is initialized).	

 AutoEdge 	Controls whether the bridge should enable automatic edge detection on the
	bridge port. This allows operEdge to be derived from whether BPDU's are
	received on the port or not.
Restricted Role	If enabled, causes the port not to be selected as Root Port for the CIST or any
	MSTI, even if it has the best spanning tree priority vector. Such a port will be
	selected as an Alternate Port after the Root Port has been selected. If set, it can
	cause lack of spanning tree connectivity. It can be set by a network administrator
	to prevent bridges external to a core region of the network influence the
	spanning tree active topology, possibly because those bridges are not under the
	full control of the administrator. This feature is also known as Root Guard .
Restricted TCN	If enabled, causes the port not to propagate received topology change
	notifications and topology changes to other ports. If set it can cause temporary
	loss of connectivity after changes in a spanning tree's active topology as a result
	of persistently incorrect learned station location information. It is set by a
	network administrator to prevent bridges external to a core region of the
	network, causing address flushing in that region, possibly because those bridges
	are not under the full control of the administrator or the physical link state of the
	attached LANs transits frequently.
BPDU Guard	If enabled, causes the port to disable itself upon receiving valid BPDU's.
	Contrary to the similar bridge setting, the port Edge status does not effect this
	setting.
	A port entering error-disabled state due to this setting is subject to the bridge
	Port Error Recovery setting as well.
Point-to-point	Controls whether the port connects to a point-to-point LAN rather than a shared
	medium. This can be automatically determined, or forced either true or false.
	Transitions to the forwarding state is faster for point-to-point LANs than for
	shared media.

Buttons

Apply: Click to apply changes

By default, the system automatically detects the speed and duplex mode used on each port, and configures the path cost according to the values shown below. Path cost "0" is used to indicate auto-configuration mode. When the short path cost method is selected and the default path cost recommended by the IEEE 8021w standard exceeds 65,535, the default is set to 65,535.

Port Type	IEEE 802.1D-1998	IEEE 802.1w-2001
Ethernet	50-600	200,000-20,000,000
Fast Ethernet	10-60	20,000-2,000,000
Gigabit Ethernet	3-10	2,000-200,000

Table 4-3-4-1: Recommended STP Path Cost Range

Port Type	Link Type	IEEE 802.1D-1998	IEEE 802.1w-2001
Ethernet	Half Duplex	100	2,000,000
	Full Duplex	95	1,999,999
	Trunk	90	1,000,000
Fast Ethernet	Half Duplex	19	200,000
	Full Duplex	18	100,000
	Trunk	15	50,000
Gigabit Ethernet	Full Duplex	4	10,000
	Trunk	3	5,000

Table 4-3-4-2: Recommended STP Path Costs

Ethernet	Half Duplex	2,000,000
	Full Duplex	1,000,000
	Trunk	500,000
Fast Ethernet	Half Duplex	200,000
	Full Duplex	100,000
	Trunk	50,000
Gigabit Ethernet	Full Duplex	10,000
	Trunk	5,000

Table 4-3-4-3: Default STP Path Costs

4.3.4.5 MSTI Priorities

This page allows the user to inspect the current STP MSTI bridge instance priority configurations, and possibly change them as well. The MSTI Priority screen in Figure 4-3-4-7 appears.

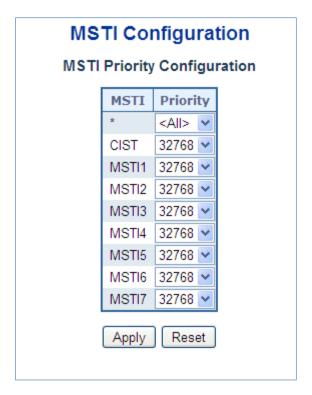

Figure 4-3-4-7: MSTI Priority Page Screenshot

The page includes the following fields:

Object	Description
• MSTI	The bridge instance. The CIST is the default instance, which is always active.
• Priority	Controls the bridge priority. Lower numerical values have better priority. The
	bridge priority plus the MSTI instance number, concatenated with the 6-byte
	MAC address of the switch forms a Bridge Identifier.

Buttons

Apply: Click to apply changes

4.3.4.6 MSTI Configuration

This page allows the user to inspect the current STP MSTI bridge instance priority configurations, and possibly change them as well. The MSTI Configuration screen in Figure 4-3-4-8 appears.

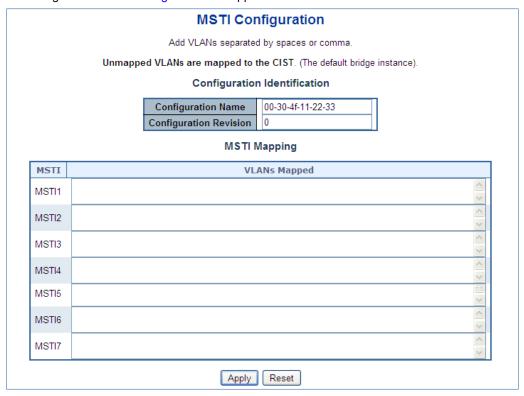

Figure 4-3-4-8: MSTI Configuration Page Screenshot

The page includes the following fields:

Configuration Identification

Object	Description
• Configuration	The name identifying the VLAN to MSTI mapping. Bridges must share the name and
Name	revision (see below), as well as the VLAN-to-MSTI mapping configuration in order to
	share spanning trees for MSTI's. (Intra-region). The name is at most 32 characters.
Configuration	The revision of the MSTI configuration named above. This must be an integer
Revision	between 0 and 65535.

MSTI Mapping

Object	Description
• MSTI	The bridge instance. The CIST is not available for explicit mapping, as it will receive
	the VLANs not explicitly mapped.
VLANs Mapped	The list of VLAN's mapped to the MSTI. The VLANs must be separated with comma
	and/or space. A VLAN can only be mapped to <i>one</i> MSTI. A unused MSTI should just
	be left empty. (I.e. not having any VLANs mapped to it.)

4.3.4.7 MSTI Ports Configuration

This page allows the user to inspect the current STP MSTI port configurations, and possibly change them as well. A MSTI port is a virtual port, which is instantiated separately for each active CIST (physical) port for each MSTI instance configured and applicable for the port. The MSTI instance must be selected before displaying actual MSTI port configuration options.

This page contains MSTI port settings for physical and aggregated ports. The aggregation settings are global. The MSTI Port Configuration screen in Figure 4-3-4-9 & Figure 4-3-4-10 appears.

Figure 4-3-4-9: MSTI Port Configuration Page Screenshot

The page includes the following fields:

MSTI Port Configuration

Object	Description
Select MSTI	Select the bridge instance and set more detail configuration.

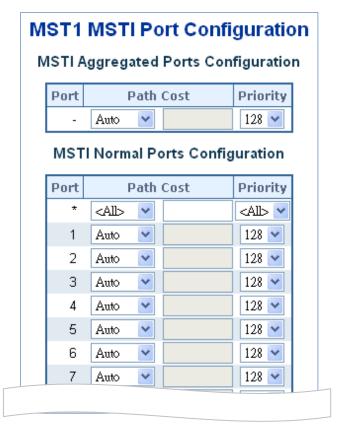

Figure 4-3-4-10: MSTI MSTI Port Configuration Page Screenshot

The page includes the following fields:

MSTx MSTI Port Configuration

Object	Description
• Port	The switch port number of the corresponding STP CIST (and MSTI) port.
• Path Cost	Controls the path cost incurred by the port. The Auto setting will set the path
	cost as appropriate by the physical link speed, using the 802.1D recommended
	values. Using the Specific setting, a user-defined value can be entered. The
	path cost is used when establishing the active topology of the network. Lower
	path cost ports are chosen as forwarding ports in favor of higher path cost ports.
	Valid values are in the range 1 to 200000000.
• Priority	Controls the port priority. This can be used to control priority of ports having
	identical port cost.

4.3.4.8 Port Status

This page displays the STP CIST port status for port physical ports in the currently selected switch.

The STP Port Status screen in Figure 4-3-4-11 appears.

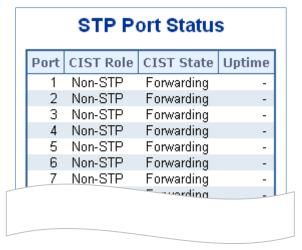

Figure 4-3-4-11: STP Port Status Page Screenshot

The page includes the following fields:

Object	Description
• Port	The switch port number of the logical STP port.
CIST Role	The current STP port role of the ICST port. The port role can be one of the
	following values:
	■ AlternatePort
	■ BackupPort
	■ RootPort
	■ DesignatedPort
	■ Disable
CIST State	The current STP port state of the CIST port . The port state can be one of the
	following values:
	■ Disabled
	■ Learning
	■ Forwarding
• Uptime	The time since the bridge port was last initialized.

4.3.4.9 Port Statistics

This page displays the STP port statistics counters for port physical ports in the currently selected switch.

The STP Port Statistics screen in Figure 4-3-4-12 appears.

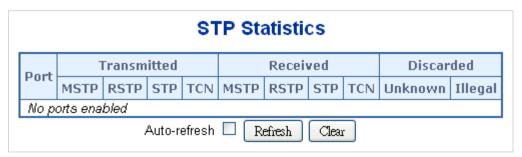

Figure 4-3-4-12: STP Statistics Page Screenshot

The page includes the following fields:

Object	Description	
• Port	The switch port number of the logical RSTP port.	
• MSTP	The number of MSTP Configuration BPDU's received/transmitted on the port.	
• RSTP	The number of RSTP Configuration BPDU's received/transmitted on the port.	
• STP	The number of legacy STP Configuration BPDU's received/transmitted on the	
	port.	
• TCN	The number of (legacy) Topology Change Notification BPDU's	
	received/transmitted on the port.	
Discarded Unknown	The number of unknown Spanning Tree BPDU's received (and discarded) on	
	the port.	
Discarded Illegal	The number of illegal Spanning Tree BPDU's received (and discarded) on the	
	port.	

Buttons

Auto-refresh : Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

Clear: Clears the counters for all ports.

4.3.5 IGMP Snooping

4.3.5.1 IGMP Snooping

The Internet Group Management Protocol (IGMP) lets host and routers share information about multicast groups memberships. IGMP snooping is a switch feature that monitors the exchange of IGMP messages and copies them to the CPU for feature processing. The overall purpose of IGMP Snooping is to limit the forwarding of multicast frames to only ports that are a member of the multicast group.

About the Internet Group Management Protocol (IGMP) Snooping

Computers and network devices that want to receive multicast transmissions need to inform nearby routers that they will become members of a multicast group. The **Internet Group Management Protocol (IGMP)** is used to communicate this information. IGMP is also used to periodically check the multicast group for members that are no longer active. In the case where there is more than one multicast router on a sub network, one router is elected as the 'queried'. This router then keeps track of the membership of the multicast groups that have active members. The information received from IGMP is then used to determine if multicast packets should be forwarded to a given sub network or not. The router can check, using IGMP, to see if there is at least one member of a multicast group on a given subnet work. If there are no members on a sub network, packets will not be forwarded to that sub network.

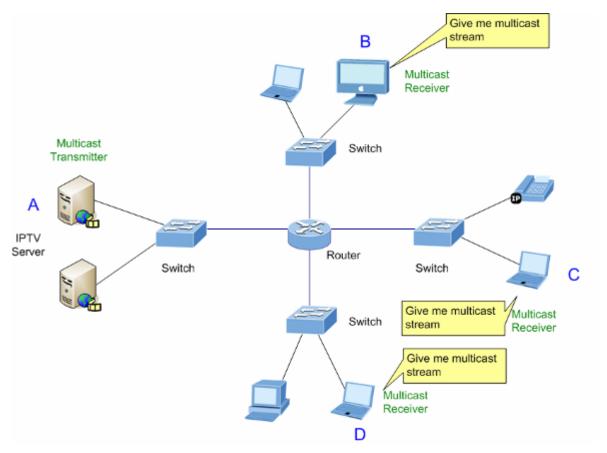

Figure 4-3-5-1: Multicast Service

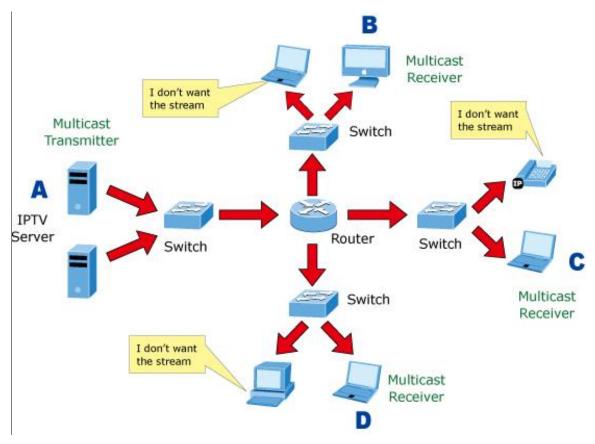

Figure 4-3-5-2: Multicast Flooding

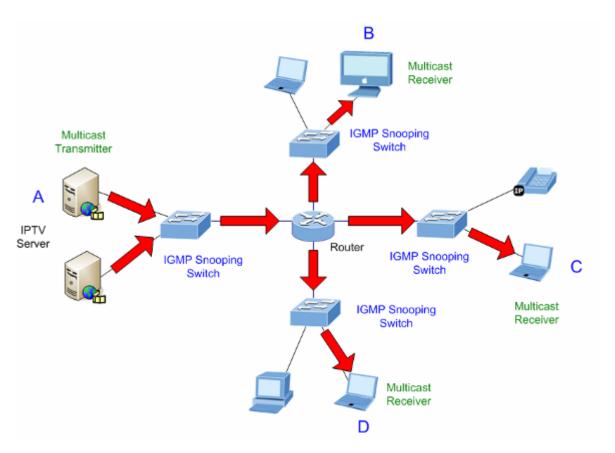

Figure 4-3-5-3: IGMP Snooping Multicast Stream Control

IGMP Versions 1 and 2

Multicast groups allow members to join or leave at any time. IGMP provides the method for members and multicast routers to communicate when joining or leaving a multicast group. IGMP version 1 is defined in RFC 1112. It has a fixed packet size and no optional data. The format of an IGMP packet is shown below:

IGMP Message Format

Octets			
0	8	16	31
	Туре	Response Time	Checksum
		Group Address	s (all zeros if this is a query)

The IGMP Type codes are shown below:

Туре	Meaning
0x11	Membership Query (if Group Address is 0.0.0.0)
0x11	Specific Group Membership Query (if Group Address is Present)
0x16	Membership Report (version 2)
0x17	Leave a Group (version 2)
0x12	Membership Report (version 1)

IGMP packets enable multicast routers to keep track of the membership of multicast groups, on their respective sub networks.

The following outlines what is communicated between a multicast router and a multicast group member using IGMP.

A host sends an IGMP "report" to join a group

A host will never send a report when it wants to leave a group (for version 1).

A host will send a "leave" report when it wants to leave a group (for version 2).

Multicast routers send IGMP queries (to the all-hosts group address: 224.0.0.1) periodically to see whether any group members exist on their sub networks. If there is no response from a particular group, the router assumes that there are no group members on the network.

The Time-to-Live (TTL) field of query messages is set to 1 so that the queries will not be forwarded to other sub networks.

IGMP version 2 introduces some enhancements such as a method to elect a multicast queried for each LAN, an explicit leave message, and query messages that are specific to a given group.

The states a computer will go through to join or to leave a multicast group are shown below:

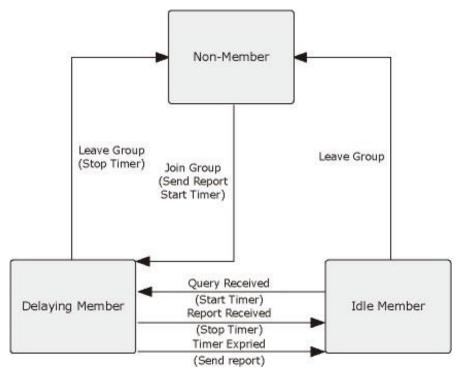

Figure 4-3-5-4: IGMP State Transitions

■ IGMP Querier –

A router, or multicast-enabled switch, can periodically ask their hosts if they want to receive multicast traffic. If there is more than one router/switch on the LAN performing IP multicasting, one of these devices is elected "querier" and assumes the role of querying the LAN for group members. It then propagates the service requests on to any upstream multicast switch/router to ensure that it will continue to receive the multicast service.

Multicast routers use this information, along with a multicast routing protocol such as DVMRP or PIM, to support IP multicasting across the Internet.

4.3.5.2 Profile Table

This page provides IPMC Profile related configurations. The IPMC profile is used to deploy the access control on IP multicast streams. It is allowed to create at maximum 64 Profiles with at maximum 128 corresponding rules for each. The Profile Table screen in Figure 4-3-5-5 appears.

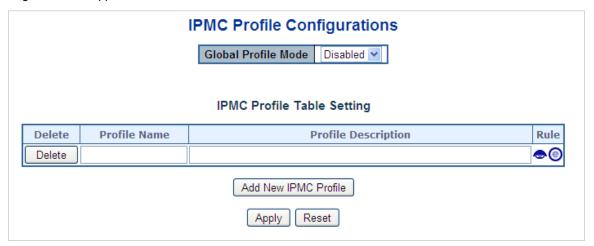

Figure 4-3-5-5: IPMC Profile Configuration Page

The page includes the following fields:

Object	Description	
Global Profile Mode	Enable/Disable the Global IPMC Profile.	
	System starts to do filtering based on profile settings only when the global profile	
	mode is enabled.	
• Delete	Check to delete the entry.	
	The designated entry will be deleted during the next save.	
Profile Name	The name used for indexing the profile table.	
	Each entry has the unique name which is composed of at maximum 16 alphabetic	
	and numeric characters. At least one alphabet must be present.	
• Profile Description	Additional description, which is composed of at maximum 64 alphabetic and	
	numeric characters, about the profile.	
	No blank or space characters are permitted as part of description. Use "_" or "-" to	
	separate the description sentence.	
• Rule	When the profile is created, click the edit button to enter the rule setting page of	
	the designated profile. Summary about the designated profile will be shown by	
	clicking the view button. You can manage or inspect the rules of the designated	
	profile by using the following buttons:	
	• List the rules associated with the designated profile.	
	Adjust the rules associated with the designated profile.	

Buttons

Add New IPMC Profile : Click to add new IPMC profile. Specify the name and configure the new entry. Click "Save".

Apply : Click to apply changes

Reset : Click to undo any changes made locally and revert to previously saved values.

4.3.5.3 Address Entry

This page provides address range settings used in IPMC profile. The address entry is used to specify the address range that will be associated with IPMC Profile. It is allowed to create at maximum 128 address entries in the system. The Profile Table screen in Figure 4-3-5-6 appears.

Figure 4-3-5-6: IPMC Profile Address Configuration Page

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry.
	The designated entry will be deleted during the next save.
Entry Name	The name used for indexing the address entry table.
	Each entry has the unique name which is composed of at maximum 16
	alphabetic and numeric characters. At least one alphabet must be present.
Start Address	The starting IPv4/IPv6 Multicast Group Address that will be used as an address
	range.
End Address	The ending IPv4/IPv6 Multicast Group Address that will be used as an address
	range.

Buttons

Add New Address (Range) Entry: Click to add new address range. Specify the name and configure the addresses. Click "Save".

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Refresh: Refreshes the displayed table starting from the input fields.

Less: Updates the table starting from the first entry in the IPMC Profile Address Configuration.

>>>: Updates the table, starting with the entry after the last entry currently displayed.

4.3.5.4 IGMP Snooping Configuration

This page provides IGMP Snooping related configuration. The IGMP Snooping Configuration screen in Figure 4-3-5-7 appears.

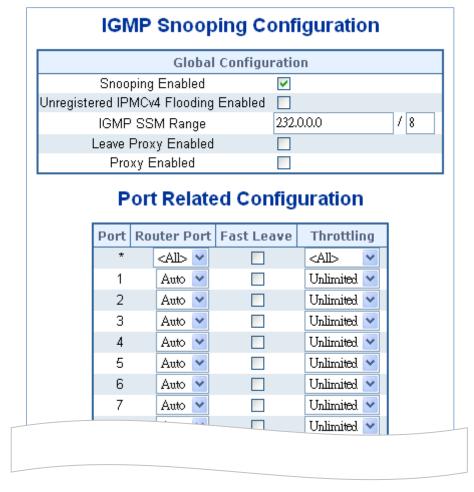

Figure 4-3-5-7: IGMP Snooping Configuration Page Screenshot

The page includes the following fields:

Object	Description	
Snooping Enabled	Enable the Global IGMP Snooping.	
Unregistered IPMCv4	Enable unregistered IPMCv4 traffic flooding.	
Flooding Enabled	The flooding control takes effect only when IGMP Snooping is enabled.	
	When IGMP Snooping is disabled, unregistered IPMCv4 traffic flooding is	
	always active in spite of this setting.	
IGMP SSM Range	SSM (Source-Specific Multicast) Range allows the SSM-aware hosts and	
	routers run the SSM service model for the groups in the address range.	
Leave Proxy Enable	Enable IGMP Leave Proxy. This feature can be used to avoid forwarding	
	unnecessary leave messages to the router side.	
Proxy Enable	Enable IGMP Proxy. This feature can be used to avoid forwarding unnecessary	
	join and leave messages to the router side.	

Router Port	Specify which ports act as IGMP router ports. A router port is a port on the	
	Ethernet switch that leads towards the Layer 3 multicast device or IGMP querier.	
	The Switch forwards IGMP join or leave packets to an IGMP router port.	
	■ Auto:	
	Select "Auto" to have the Industrial Managed Switch automatically	
	uses the port as IGMP Router port if the port receives IGMP query	
	packets.	
	■ Fix:	
	The Industrial Managed Switch always uses the specified port as	
	an IGMP Router port. Use this mode when you connect an IGMP	
	multicast server or IP camera which applied with multicast protocol to	
	the port.	
	■ None:	
	The Industrial Managed Switch will not use the specified port as an	
	IGMP Router port. The Industrial Managed Switch will not keep any	
	record of an IGMP router being connected to this port. Use this mode	
	when you connect other IGMP multicast servers directly on the non-	
	querier Industrial Managed Switch and don't want the multicast	
	stream to be flooded by uplinking switch through the port that is	
	connected to the IGMP querier.	
Fast Leave	Enable the fast leave on the port.	
Throtting	Enable to limit the number of multicast groups to which a switch port can belong.	

Buttons

Apply: Click to apply changes

4.3.5.5 IGMP Snooping VLAN Configuration

Each page shows up to 99 entries from the VLAN table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The "VLAN" input fields allow the user to select the starting point in the VLAN Table. The IGMP Snooping VLAN Configuration screen in Figure 4-3-5-8 appears.

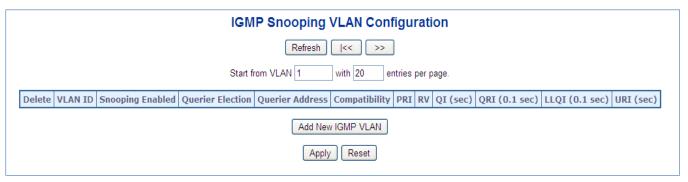

Figure 4-3-5-8: IGMP Snooping VLAN Configuration Page Screenshot

The page includes the following fields:

Object	Description	
• Delete	Check to delete the entry. The designated entry will be deleted during the next	
	save.	
VLAN ID	The VLAN ID of the entry.	
IGMP Snooping Enable	Enable the per-VLAN IGMP Snooping. Only up to 32 VLANs can be selected.	
Querier Election	Enable the IGMP Querier election in the VLAN. Disable to act as an IGMP Non-	
	Querier.	
Querier Address	Define the IPv4 address as source address used in IP header for IGMP Querier	
	election.	
	■ When the Querier address is not set, system uses IPv4 management	
	address of the IP interface associated with this VLAN.	
	■ When the IPv4 management address is not set, system uses the first	
	available IPv4 management address. Otherwise, system uses a pre-	
	defined value.	
	By default, this value will be 192.0.2.1	
• Compatibility	Compatibility is maintained by hosts and routers taking appropriate actions	
	depending on the versions of IGMP operating on hosts and routers within a	
	network. The allowed selection is IGMP-Auto, Forced IGMPv1, Forced	
	IGMPv2, Forced IGMPv3.	
	Default compatibility value is IGMP-Auto .	
• PRI	(PRI) Priority of Interface. It indicates the IGMP control frame priority level	

generated by the system. These values can be used to prioritize different
classes of traffic.
The ellowed range is 0 (heet effort) to 7 (highest) default interface priority value
The allowed range is 0 (best effort) to 7 (highest), default interface priority value
is 0
Robustness Variable. The Robustness Variable allows tuning for the expected
packet loss on a network.
The allowed range is 1 to 255 , default robustness variable value is 2.
Query Interval. The Query Interval is the interval between General Queries sent
by the Querier. The allowed range is 1 to 31744 seconds, default query interval
is 125 seconds.
Query Response Interval. The Max Response Time used to calculate the Max
Resp Code inserted into the periodic General Queries.
The allowed range is 0 to 31744 in tenths of seconds, default query response
interval is 100 in tenths of seconds (10 seconds).
Last Member Query Interval. The Last Member Query Time is the time value
represented by the Last Member Query Interval, multiplied by the Last Member
Query Count.
The allowed range is 0 to 31744 in tenths of seconds, default last member
query interval is 10 in tenths of seconds (1 second).
Unsolicited Report Interval. The Unsolicited Report Interval is the time between
repetitions of a host's initial report of membership in a group.
The allowed range is 0 to 31744 seconds, default unsolicited report interval is 1
second.

Buttons

Refresh: Refreshes the displayed table starting from the "VLAN" input fields.

: Updates the table starting from the first entry in the VLAN Table, i.e. the entry with the lowest VLAN ID.

: Updates the table, starting with the entry after the last entry currently displayed.

Add New IGMP VLAN : Click to add new IGMP VLAN. Specify the VID and configure the new entry.

Click "Save". The specific IGMP VLAN starts working after the corresponding static VLAN is also created.

: Click to apply changes

4.3.5.6 IGMP Snooping Port Group Filtering

In certain switch applications, the administrator may want to control the multicast services that are available to end users. For example, an IP/TV service based on a specific subscription plan. The IGMP filtering feature fulfills this requirement by restricting access to specified multicast services on a switch port, and IGMP throttling limits the number of simultaneous multicast groups a port can join.

IGMP filtering enables you to assign a profile to a switch port that specifies multicast groups that are permitted or denied on the port. An IGMP filter profile can contain one or more, or a range of multicast addresses; but only one profile can be assigned to a port. When enabled, IGMP join reports received on the port are checked against the filter profile. If a requested multicast group is permitted, the IGMP join report is forwarded as normal. If a requested multicast group is denied, the IGMP join report is dropped.

IGMP throttling sets a maximum number of multicast groups that a port can join at the same time. When the maximum number of groups is reached on a port, the switch can take one of two actions; either "deny" or "replace". If the action is set to deny, any new IGMP join reports will be dropped. If the action is set to replace, the switch randomly removes an existing group and replaces it with the new multicast group. The IGMP Snooping Port Group Filtering Configuration screen in Figure 4-3-5-9 appears.

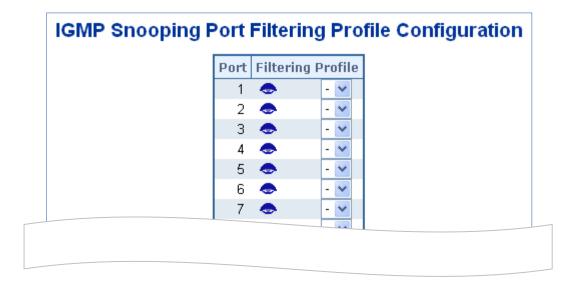

Figure 4-3-5-9: IGMP Snooping Port Filtering Profile Configuration Page Screenshot

The page includes the following fields:

Object	Description	
• Port	The logical port for the settings.	
Filtering Profile	Select the IPMC Profile as the filtering condition for the specific port. Summary	
	about the designated profile will be shown by clicking the view button	

Buttons

Apply: Click to apply changes

4.3.5.7 IGMP Snooping Status

This page provides IGMP Snooping status. The IGMP Snooping Status screen in Figure 4-3-5-10 appears.

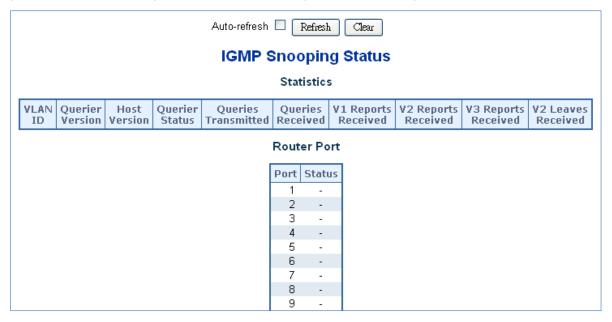

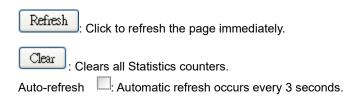

Figure 4-3-5-10: IGMP Snooping Status Page Screenshot

The page includes the following fields:

Object	Description
VLAN ID	The VLAN ID of the entry.
Querier Version	Working Querier Version currently.
Host Version	Working Host Version currently.
Querier Status	Show the Querier status is "ACTIVE" or "IDLE".
Querier Transmitted	The number of Transmitted Querier.
Querier Received	The number of Received Querier.
V1 Reports Received	The number of Received V1 Reports.
V2 Reports Received	The number of Received V2 Reports.
V3 Reports Received	The number of Received V3 Reports.
V2 Leave Received	The number of Received V2 Leave.
Router Port	Display which ports act as router ports. A router port is a port on the Ethernet
	switch that leads towards the Layer 3 multicast device or IGMP querier.
	Static denotes the specific port is configured to be a router port.
	Dynamic denotes the specific port is learnt to be a router port.
	Both denote the specific port is configured or learnt to be a router port.
• Port	Switch port number.
• Status	Indicate whether specific port is a router port or not.

Buttons

4.3.5.8 IGMP Group Information

Entries in the IGMP Group Table are shown on this Page. The IGMP Group Table is sorted first by VLAN ID, and then by group.

Each page shows up to 99 entries from the IGMP Group table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the IGMP Group Table. The "Start from VLAN", and "group" input fields allow the user to select the starting point in the IGMP Group Table. The IGMP Groups Information screen in Figure 4-3-5-11 appears.

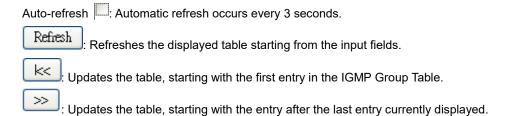

Figure 4-3-5-11: IGMP Snooping Groups Information Page Screenshot

The page includes the following fields:

Object	Description
VLAN ID	VLAN ID of the group.
• Groups	Group address of the group displayed.
Port Members	Ports under this group.

Buttons

4.3.5.9 IGMPv3 SFM Information (Only applies to switches installed with firmware v1.2112bxxxxxx)

Entries in the IGMP SFM Information Table are shown on this page. The IGMP SFM (Source-Filtered Multicast) Information Table also contains the SSM (Source-Specific Multicast) information. This table is sorted first by VLAN ID, then by group, and then by Port. Different source addresses belong to the same group are treated as single entry. The IGMP SFM Information screen in Figure 4-3-5-12 appears.

Figure 4-3-5-12: IGMPv3 SFM Information Page Screenshot

The page includes the following fields:

Object	Description
VLAN ID	VLAN ID of the group.
• Groups	Group address of the group displayed.
• Port	Switch port number.
Mode	Indicates the filtering mode maintained per (VLAN ID, port number, Group Address)
	basis. It can be either Include or Exclude.
Source Address	IP Address of the source.
	Currently, the maximum number of IPv4 source address for filtering (per group) is 8.
	When there is no any source filtering address, the text "None" is shown in the
	Source Address field.
• Type	Indicates the Type. It can be either Allow or Deny.
Hardware Filter/Switch	Indicates whether data plane destined to the specific group address from the source
	IPv4 address could be handled by chip or not.

Buttons

Auto-refresh : Automatic refresh occurs every 3 seconds.

VLAN ID	VLAN ID of the group.
• Groups	Group address of the group displayed.
• Port Members	Ports under this group.

Buttons

4.3.6.6 MLDv2 Information

Entries in the MLD SFM Information Table are shown on this page. The MLD SFM (Source-Filtered Multicast) Information Table also contains the SSM (Source-Specific Multicast) information. This table is sorted first by VLAN ID, then by group, and then by Port. Different source addresses belong to the same group are treated as single entry. Each page shows up to 99 entries from the MLD SFM Information table, default being 20, selected through the "entries per page" input field. When first visited, the web Page will show the first 20 entries from the beginning of the MLD SFM Information Table.

The "Start from VLAN", and "group" input fields allow the user to select the starting point in the MLD SFM Information Table.

The MLDv2 Information screen in Figure 4-3-6-6 appears.

Figure 4-3-6-6: MLD SSM Information Page Screenshot

The page includes the following fields:

Object	Description
VLAN ID	VLAN ID of the group.
• Group	Group address of the group displayed.
• Port	Switch port number.
• Mode	Indicates the filtering mode maintained per (VLAN ID, port number, Group
	Address) basis. It can be either Include or Exclude.
Source Address	IP Address of the source. Currently, system limits the total number of IP source
	addresses for filtering to be 128.
• Type	Indicates the Type. It can be either Allow or Deny.
Hardware Filter/Switch	Indicates whether data plane destined to the specific group address from the
	source IPv6 address could be handled by chip or not.

Buttons

Auto-refresh : Automatic refresh occurs every 3 seconds.

Refresh: Refreshes the displayed table starting from the input fields.

Let : Updates the table starting from the first entry in the MLD SFM Information Table.

Description: Updates the table, starting with the entry after the last entry currently displayed.

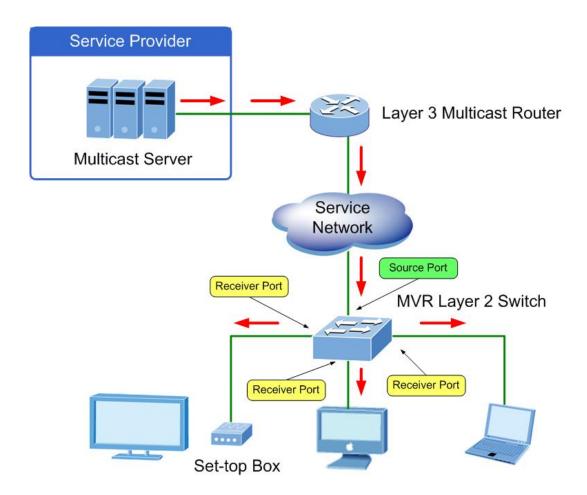

4.3.7 MVR (Multicast VLAN Registration)

The MVR feature enables multicast traffic forwarding on the Multicast VLANs.

- In a multicast television application, a PC or a network television or a set-top box can receive the multicast stream.
- Multiple set-top boxes or PCs can be connected to one subscriber port, which is a switch port configured as an MVR receiver port. When a subscriber selects a channel, the set-top box or PC sends an IGMP/MLD report message to Switch A to join the appropriate multicast group address.
- Uplink ports that send and receive multicast data to and from the multicast VLAN are called MVR source ports.

It is allowed to create at maximum 8 MVR VLANs with corresponding channel settings for each Multicast VLAN. There will be totally at maximum 256 group addresses for channel settings.

4.3.7.1 MVR Configuration

. This page provides MVR related configuration. The MVR screen in Figure 4-3-7-1 appears

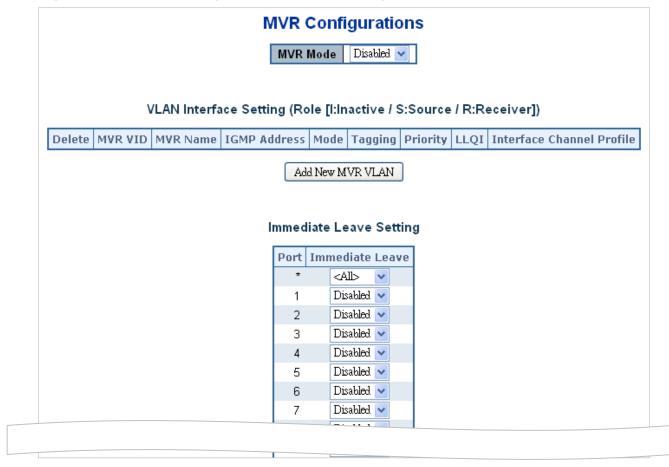

Figure 4-3-7-1: MVR Configuration Page Screenshot

The page includes the following fields:

Object	Description
MVR Mode	Enable/Disable the Global MVR.
	The Unregistered Flooding control depends on the current configuration in IGMP/MLD
	Snooping.
	It is suggested to enable Unregistered Flooding control when the MVR group table is full.
• Delete	Check to delete the entry. The designated entry will be deleted during the next save.
MVR VID	Specify the Multicast VLAN ID.
	Be Caution: MVR source ports are not recommended to be overlapped with
	management VLAN ports.
MVR Name	MVR Name is an optional attribute to indicate the name of the specific MVR VLAN.
	Maximum length of the MVR VLAN Name string is 16. MVR VLAN Name can only contain
	alphabets or numbers. When the optional MVR VLAN name is given, it should contain at
	least one alphabet. MVR VLAN name can be edited for the existing MVR VLAN entries or
	it can be added to the new entries.
• IGMP Address	Define the IPv4 address as source address used in IP header for IGMP control frames.
	The default IGMP address is not set (0.0.0.0).
	When the IGMP address is not set, system uses IPv4 management address of the IP

interface associated with this VLAN. When the IPv4 management address is not set, system uses the first available IPv4 management address. Otherwise, system uses a pre-defined value. By default, this value will be 192.0.2.1. Mode Specify the MVR mode of operation. In Dynamic mode, MVR allows dynamic MVR membership reports on source ports. The default is Dynamic mode. Specify whether the traversed IGMP/MLD control frames will be sent as Untagged or Tagged with MVR VID. The default is Tagged. Priority Specify how the traversed IGMP/MLD control frames will be sent in prioritized manner. The default Priority is 0. LLQI Define the maximum time to wait for IGMP/MLD report memberships on a receiver port before removing the port from multicast group membership. The value is in units of tenths of a seconds. The range is from 0 to 31744. The default LLQI is 5 tenths or one-half second. Interface Channel Setting When the MVR VLAN is created, select the IPMC Profile as the channel filtering condition for the specific MVR VLAN. Summary about the Interface Channel Profiling (of the MVR VLAN) will be shown by clicking the view button. Profile selected for designated interface channel is not allowed to have overlapped permit group address. Port The logical port for the settings. Configure an MVR port of the designated MVR VLAN as one of the following roles. Inactive: The designated port does not participate MVR operations. Source: Configure uplink ports that receive and send multicast data as source ports. Subscribers cannot be directly connected to source ports. Receiver: Configure a port as a receive data unless it becomes a member of the multicast group by issuing IGMP/MLD messages. Be Caution: MVR source ports are not receive data unless it becomes a member of the multicast group by issuing IGMP/MLD messages. Be Caution: MVR source ports are not receive data unless it becomes a member of the multicate group by issuing IGMP/MLD messages. Be Caution: MVR source ports are not receive data unless it becomes a member of t		
management address. Otherwise, system uses a pre-defined value. By default, this value will be 192.0.2.1. Mode Specify the MVR mode of operation. In Dynamic mode, MVR allows dynamic MVR membership reports on source ports. In Compatible mode, MVR membership reports are forbidden on source ports. The default is Dynamic mode. Tagging Specify whether the traversed IGMP/MLD control frames will be sent as Untagged or Tagged with MVR VID. The default is Tagged. Priority Specify how the traversed IGMP/MLD control frames will be sent in prioritized manner. The default Priority is 0. LLQI Define the maximum time to wait for IGMP/MLD report memberships on a receiver port before removing the port from multicast group membership. The value is in units of tenths of a seconds. The range is from 0 to 31744. The default LLQI is 5 tenths or one-half second. 4.3.7.2 MVR Status

This page provides MVR status. The MVR Status screen in Figure 4-3-7-2 appears.

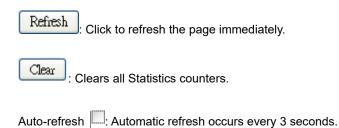

Figure 4-3-7-2: MVR Status Page Screenshot

The page includes the following fields:

Object	Description
VLAN ID	The Multicast VLAN ID.
IGMP/MLD Queries Received	The number of Received Queries for IGMP and MLD, respectively.
IGMP/MLD Queries Transmitted	The number of Transmitted Queries for IGMP and MLD, respectively.
IGMPv1 Joins Received	The number of Received IGMPv1 Joins.
IGMPv2/MLDv1 Reports Received	The number of Received IGMPv2 Joins and MLDv1 Reports, respectively.
IGMPv3/MLDv2 Reports Received	The number of Received IGMPv1 Joins and MLDv2 Reports, respectively.
IGMPv2/MLDv1 Leaves Received	The number of Received IGMPv2 Leaves and MLDv1 Dones,
	respectively.

4.3.7.3 MVR Groups Information

Entries in the MVR Group Table are shown on this page. The MVR Group Table is sorted first by VLAN ID, and then by group. Each page shows up to 99 entries from the MVR Group table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MVR Group Table.

The "Start from VLAN", and "group" input fields allow the user to select the starting point in the MVR Group Table. The MVR Groups Information screen in Figure 4-3-7-3 appears.

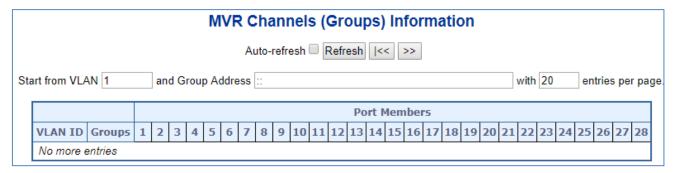

Figure 4-3-7-3: MVR Groups Information Page Screenshot

The page includes the following fields:

Object	Description
• VLAN	VLAN ID of the group.
• Groups	Group ID of the group displayed.
Port Members	Ports under this group.

Buttons

Auto-refresh :: Automatic refresh occurs every 3 seconds.

Refresh: Refreshes the displayed table starting from the input fields.

Level: Updates the table starting from the first entry in the MVR Channels (Groups) Information Table.

Level: Updates the table, starting with the entry after the last entry currently displayed.

4.3.7.4 MVR SFM Information

Entries in the MVR SFM Information Table are shown on this page. The MVR **SFM** (**Source-Filtered Multicast**) Information Table also contains the SSM (Source-Specific Multicast) information. This table is sorted first by VLAN ID, then by group, and then by Port. Different source addresses belong to the same group are treated as single entry.

Each page shows up to 99 entries from the MVR SFM Information Table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MVR SFM Information Table.

The "Start from VLAN", and "Group Address" input fields allow the user to select the starting point in the MVR SFM Information Table. The MVR SFM Information screen in Figure 4-3-7-4 appears.

				MVF	R SFM Inform	natio	n
			Auto	-refresh	Refresh	« :	»>
Start from VLAN	1 and	l Group A	Addres	S ::			with 20 entries per page.
	VLAN ID	Group	Port	Mode	Source Address	Type	Hardware Filter/Switch
	No more e	entries					

Figure 4-3-7-4: MVR SFM Information Page Screenshot

The page includes the following fields:

Object	Description
VLAN ID	VLAN ID of the group.
• Group	Group address of the group displayed.
• Port	Switch port number.
• Mode	Indicates the filtering mode maintained per (VLAN ID, port number, Group
	Address) basis. It can be either Include or Exclude.
Source Address	IP Address of the source. Currently, system limits the total number of IP source
	addresses for filtering to be 128. When there is no any source filtering address,
	the text "None" is shown in the Source Address field.
• Type	Indicates the Type. It can be either Allow or Deny.
Hardware Filter /	Indicates whether data plane destined to the specific group address from the
Switch	source IPv4/IPv6 address could be handled by chip or not.

Buttons

Auto-refresh :: Automatic refresh occurs every 3 seconds.

Refreshes the displayed table starting from the input fields.

Updates the table starting from the first entry in the MVR SFM Information Table.

4.3.8 LLDP

4.3.8.1 Link Layer Discovery Protocol

Link Layer Discovery Protocol (LLDP) is used to discover basic information about neighboring devices on the local broadcast domain. LLDP is a Layer 2 protocol that uses periodic broadcasts to advertise information about the sending device. Advertised information is represented in Type Length Value (TLV) format according to the IEEE 802.1ab standard, and can include details such as device identification, capabilities and configuration settings. LLDP also defines how to store and maintain information gathered about the neighboring network nodes it discovers.

Link Layer Discovery Protocol - Media Endpoint Discovery (LLDP-MED) is an extension of LLDP intended for managing endpoint devices such as Voice over IP phones and network switches. The LLDP-MED TLVs advertise information such as network policy, power, inventory, and device location details. LLDP and LLDP-MED information can be used by SNMP applications to simplify troubleshooting, enhance network management, and maintain an accurate network topology.

4.3.8.2 LLDP Configuration

This page allows the user to inspect and configure the current LLDP port settings. The LLDP Configuration screen in Figure 4-3-8-1 appears.

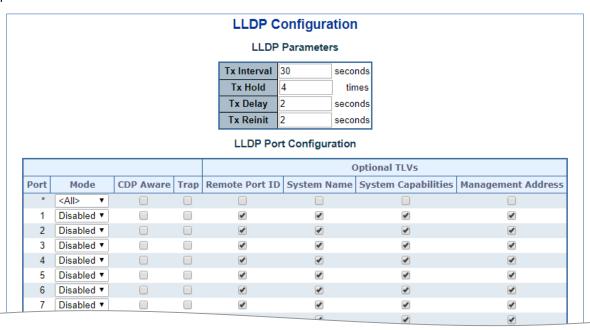

Figure 4-3-8-1: LLDP Configuration Page Screenshot

The page includes the following fields:

LLDP Parameters

Object	Description
Tx Interval	The switch is periodically transmitting LLDP frames to its neighbors for having the
	network discovery information up-to-date. The interval between each LLDP frame is
	determined by the Tx Interval value. Valid values are restricted to 5 - 32768
	seconds.
	Default: 30 seconds
	This attribute must comply with the following rule:
	(Transmission Interval * Hold Time Multiplier) ≤65536, and Transmission Interval >=
	(4 * Delay Interval)
• Tx Hold	Each LLDP frame contains information about how long the information in the LLDP
	frame shall be considered valid. The LLDP information valid period is set to Tx Hold
	multiplied by Tx Interval seconds. Valid values are restricted to 2 - 10 times.
	TTL in seconds is based on the following rule:
	(Transmission Interval * Holdtime Multiplier) ≤ 65536.
	Therefore, the default TTL is 4*30 = 120 seconds.
• Tx Delay	If some configuration is changed (e.g. the IP address) a new LLDP frame is
	transmitted, but the time between the LLDP frames will always be at least the value
	of Tx Delay seconds. Tx Delay cannot be larger than 1/4 of the Tx Interval value.
	Valid values are restricted to 1 - 8192 seconds.
	This attribute must comply with the rule:
	(4 * Delay Interval) ≤Transmission Interval
• Tx Reinit	When a port is disabled, LLDP is disabled or the switch is rebooted a LLDP
	shutdown frame is transmitted to the neighboring units, signaling that the LLDP
	information isn't valid anymore. Tx Reinit controls the amount of seconds between
	the shutdown frame and a new LLDP initialization. Valid values are restricted to 1 -
	10 seconds.

LLDP Port Configuration

The LLDP port settings relate to the switch, as reflected by the page header.

Object	Description	
• Port	The switch port number of the logical LLDP port.	
• Mode	Select LLDP mode.	
	■ Rx only The switch will not send out LLDP information, but LLDP information	
	from neighbor units is analyzed.	
	■ Tx only The switch will drop LLDP information received from neighbors, but	
	will send out LLDP information.	

■ Disabled The switch will not send out LLDP information, and will drop LLDP information received from neighbors. ■ Enabled The switch will send out LLDP information, and will analyze LLDP information received from neighbors. Select CDP awareness. The CDP operation is restricted to decoding incoming CDP frames (The switch doesn't transmit CDP frames). CDP frames are only decoded if LLDP on the port is enabled. Only CDP TLVs that can be mapped to a corresponding field in the LLDP neighbours' table are decoded. All other TLVs are discarded (Unrecognized CDP TLVs and discarded CDP frames are not shown in the LLDP statistics.). CDP TLVs are mapped onto LLDP neighbours' table as shown below. CDP TLV "Device ID" is mapped to the LLDP "Chassis ID" field. CDP TLV "Address" is mapped to the LLDP "Management Address" field. The CDP address TLV can contain multiple addresses, but only the first address is shown in the LLDP neighbours table. CDP TLV "Port ID" is mapped to the LLDP "Port ID" field. CDP TLV "Version and Platform" is mapped to the LLDP "System Description" field. Both the CDP and LLDP support "system capabilities", but the CDP capabilities cover capabilities that are not part of the LLDP. These capabilities are shown as "others" in the LLDP neighbours' table. If all ports have CDP awareness disabled the switch forwards CDP frames received from neighbour devices. If at least one port has CDP awareness enabled all CDP frames are terminated by the switch. Note: When CDP awareness on a port is disabled the CDP information isn't removed immediately, but gets removed when the hold time is exceeded.		
■ Enabled The switch will send out LLDP information, and will analyze LLDP information received from neighbors. Select CDP awareness. The CDP operation is restricted to decoding incoming CDP frames (The switch doesn't transmit CDP frames). CDP frames are only decoded if LLDP on the port is enabled. Only CDP TLVs that can be mapped to a corresponding field in the LLDP neighbours' table are decoded. All other TLVs are discarded (Unrecognized CDP TLVs and discarded CDP frames are not shown in the LLDP statistics.). CDP TLVs are mapped onto LLDP neighbours' table as shown below. CDP TLV "Device ID" is mapped to the LLDP "Chassis ID" field. CDP TLV "Address" is mapped to the LLDP "Management Address" field. The CDP address TLV can contain multiple addresses, but only the first address is shown in the LLDP neighbours table. CDP TLV "Port ID" is mapped to the LLDP "Port ID" field. CDP TLV "Version and Platform" is mapped to the LLDP "System Description" field. Both the CDP and LLDP support "system capabilities", but the CDP capabilities cover capabilities that are not part of the LLDP. These capabilities are shown as "others" in the LLDP neighbours' table. If all ports have CDP awareness disabled the switch forwards CDP frames received from neighbour devices. If at least one port has CDP awareness enabled all CDP frames are terminated by the switch. Note: When CDP awareness on a port is disabled the CDP information isn't		■ Disabled The switch will not send out LLDP information, and will drop LLDP
Select CDP awareness. The CDP operation is restricted to decoding incoming CDP frames (The switch doesn't transmit CDP frames). CDP frames are only decoded if LLDP on the port is enabled. Only CDP TLVs that can be mapped to a corresponding field in the LLDP neighbours' table are decoded. 4.3.8.3 LLDP Neighbor

This page provides a status overview for all LLDP neighbors. The displayed table contains a row for each port on which an LLDP neighbor is detected. The LLDP Neighbor Information screen in Figure 4-3-8-2 appears.

Figure 4-3-8-2: LLDP Neighbor Information Page Screenshot

The page includes the following fields:

- · · ·	
Object	Description
Local Port	The port on which the LLDP frame was received.
Chassis ID	The Chassis ID is the identification of the neighbor's LLDP frames.
Remote Port ID	The Remote Port ID is the identification of the neighbor port.
Port Description	Port Description is the port description advertised by the neighbor unit.
System Name	System Name is the name advertised by the neighbor unit.
System Capabilities	System Capabilities describes the neighbor unit's capabilities. The possible
	capabilities are:
	1. Other
	2. Repeater
	3. Bridge
	4. WLAN Access Point
	5. Router
	6. Telephone
	7. DOCSIS cable device
	8. Station only
	9. Reserved
	When a capability is enabled, the capability is followed by (+). If the capability is
	disabled, the capability is followed by (-).
Management Address	Management Address is the neighbor unit's address that is used for higher layer
	entities to assist the discovery by the network management. This could for
	instance hold the neighbor's IP address.

4.3.8.4 LLDP MED Configuration

This page allows you to configure the LLDP-MED. The LLDPMED Configuration screen in Figure 4-3-8-3 appears.

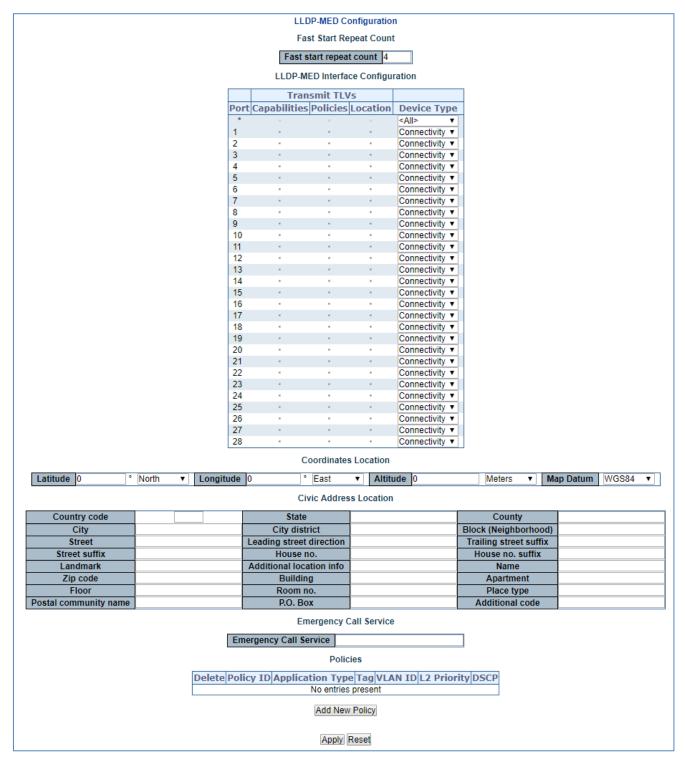

Figure 4-3-8-3: LLDPMED Configuration Page Screenshot

The page includes the following fields:

Fast start repeat count

Object	Description
Fast start repeat count	Rapid startup and Emergency Call Service Location Identification Discovery of
	endpoints is a critically important aspect of VoIP systems in general. In addition,
	it is best to advertise only those pieces of information which are specifically
	relevant to particular endpoint types (for example only advertise the voice
	network policy to permitted voice-capable devices), both in order to conserve the
	limited LLDPU space and to reduce security and system integrity issues that can
	come with inappropriate knowledge of the network policy.
	With this in mind LLDP-MED defines an LLDP-MED Fast Start interaction
	between the protocol and the application layers on top of the protocol, in order to
	achieve these related properties. Initially, a Network Connectivity Device will
	only transmit LLDP TLVs in an LLDPDU. Only after an LLDP-MED Endpoint
	Device is detected, will an LLDP-MED capable Network Connectivity Device
	start to advertise LLDP-MED TLVs in outgoing LLDPDUs on the associated port.
	The LLDP-MED application will temporarily speed up the transmission of the
	LLDPDU to start within a second, when a new LLDP-MED neighbour has been
	detected in order share LLDP-MED information as fast as possible to new
	neighbours.
	Because there is a risk of an LLDP frame being lost during transmission
	between neighbours, it is recommended to repeat the fast start transmission
	multiple times to increase the possibility of the neighbours receiving the LLDP
	frame. With Fast start repeat count it is possible to specify the number of times
	the fast start transmission would be repeated. The recommended value is 4
	times, given that 4 LLDP frames with a 1 second interval will be transmitted,
	when an LLDP frame with new information is received.
	It should be noted that LLDP-MED and the LLDP-MED Fast Start mechanism is
	only intended to run on links between LLDP-MED Network Connectivity Devices
	and Endpoint Devices, and as such does not apply to links between LAN
	infrastructure elements, including Network Connectivity Devices, or other types
	of links.

LLDP-MED Interface Configuration

Object	Description
Interface	The interface name to which the configuration applies.
Transmit TLVs -	When checked the switch's capabilities is included in LLDP-MED information
Capabilities	transmitted
Transmit TLVs -	When checked the configured policies for the interface is included in LLDP-
Policies	MED information transmitted.
Transmit TLVs -	When checked the configured location information for the switch is included
Location	in <u>LLDP-MED</u> information transmitted.
Transmit TLVs - PoE	When checked the configured PoE (Power Over Ethernet) information for the
	interface is included in <u>LLDP-MED</u> information transmitted
Device Type	Any LLDP-MED Device is operating as a specific type of LLDP-MED Device,
	which may be either a Network Connectivity Device or a specific Class of
	Endpoint Device, as defined below.
	A Network Connectivity Device is a LLDP-MED Device that provides access to
	the IEEE 802 based LAN infrastructure for LLDP-MED Endpoint Devices
	An LLDP-MED Network Connectivity Device is a LAN access device based on
	any of the following technologies :
	1. LAN Switch/Router
	2. IEEE 802.1 Bridge
	3. IEEE 802.3 Repeater (included for historical reasons)
	4. IEEE 802.11 Wireless Access Point
	5. Any device that supports the IEEE 802.1AB and MED extensions that can
	relay IEEE 802 frames via any method.
	An Endpoint Device a LLDP-MED Device that sits at the network edge and provides some aspect of IP communications service, based on IEEE 802 LAN
	technology.
	The main difference between a Network Connectivity Device and an Endpoint
	Device is that only an Endpoint Device can start the LLDP-MED information
	exchange.
	Even though a switch always should be a Network Connectivity Device, it is
	possible to configure it to act as an Endpoint Device, and thereby start the
	LLDP-MED information exchange (In the case where two Network Connectivity
	Devices are connected together)

Coordinates Location

Object	Description	
• Latitude	Latitude SHOULD be normalized to within 0-90 degrees with a maximum of 4	
	digits.	
	It is possible to specify the direction to either North of the equator or South of	
	the equator.	
• Longitude	Longitude SHOULD be normalized to within 0-180 degrees with a maximum of	
	4 digits.	
	It is possible to specify the direction to either East of the prime meridian or West	
	of the prime meridian.	
• Altitude	Altitude SHOULD be normalized to within -32767 to 32767 with a maximum of	
	4 digits.	
	It is possible to select between two altitude types (floors or meters).	
	Meters : Representing meters of Altitude defined by the vertical datum specified.	
	Floors: Representing altitude in a form more relevant in buildings which have	
	different floor-to-floor dimensions. An altitude = 0.0 is meaningful even outside a	
	building, and represents ground level at the given latitude and longitude. Inside	
	a building, 0.0 represents the floor level associated with ground level at the main	
	entrance.	
Map Datum	The Map Datum used for the coordinates given in this Option	
	■ WGS84: (Geographical 3D) - World Geodesic System 1984, CRS Code	
	4327, Prime Meridian Name: Greenwich.	
	■ NAD83/NAVD88: North American Datum 1983, CRS Code 4269, Prime	
	Meridian Name: Greenwich; The associated vertical datum is the North	
	American Vertical Datum of 1988 (NAVD88). This datum pair is to be used	
	when referencing locations on land, not near tidal water (which would use	
	Datum = NAD83/MLLW).	
	■ NAD83/MLLW: North American Datum 1983, CRS Code 4269, Prime	
	Meridian Name: Greenwich; The associated vertical datum is Mean Lower	
	Low Water (MLLW). This datum pair is to be used when referencing	
	locations on water/sea/ocean.	

Civic Address Location

IETF Geopriv Civic Address based Location Configuration Information (Civic Address LCI).

Object	Description
Country code	The two-letter ISO 3166 country code in capital ASCII letters - Example: DK, DE
	or US.
• State	National subdivisions (state, canton, region, province, prefecture).
• County	County, parish, gun (Japan), district.
• City	City, township, shi (Japan) - Example: Copenhagen
City district	City division, borough, city district, ward, chou (Japan)
Block (Neighborhood)	Neighborhood, block
• Street	Street - Example: Poppelvej
Leading street direction	Leading street direction - Example: N
Trailing street suffix	Trailing street suffix - Example: SW
Street suffix	Street suffix - Example: Ave, Platz
House no.	House number - Example: 21
House no. suffix	House number suffix - Example: A, 1/2
• Landmark	Landmark or vanity address - Example: Columbia University
Additional location	Additional location info - Example: South Wing
info	
• Name	Name (residence and office occupant) - Example: Flemming Jahn
• Zip code	Postal/zip code - Example: 2791
• Building	Building (structure) - Example: Low Library
Apartment	Unit (Apartment, suite) - Example: Apt 42
• Floor	Floor - Example: 4
Room no.	Room number - Example: 450F
Place type	Place type - Example: Office
Postal community	Postal community name - Example: Leonia
name	
• P.O. Box	Post office box (P.O. BOX) - Example: 12345
Additional code	Additional code - Example: 1320300003

Emergency Call Service

Emergency Call Service (e.g. E911 and others), such as defined by TIA or NENA.

Object	Description
Emergency Call	Emergency Call Service ELIN identifier data format is defined to carry the ELIN
Service	identifier as used during emergency call setup to a traditional CAMA or ISDN
	trunk-based PSAP. This format consists of a numerical digit string,
	corresponding to the ELIN to be used for emergency calling.

Policies

Network Policy Discovery enables the efficient discovery and diagnosis of mismatch issues with the VLAN configuration, along with the associated Layer 2 and Layer 3 attributes, which apply for a set of specific protocol applications on that port. Improper network policy configurations are a very significant issue in VoIP environments that frequently result in voice quality degradation or loss of service.

Policies are only intended for use with applications that have specific 'real-time' network policy requirements, such as interactive voice and/or video services.

The network policy attributes advertised are:

- 1. Layer 2 VLAN ID (IEEE 802.1Q-2003)
- 2. Layer 2 priority value (IEEE 802.1D-2004)
- 3. Layer 3 Diffserv code point (DSCP) value (IETF RFC 2474)

This network policy is potentially advertised and associated with multiple sets of application types supported on a given port. The application types specifically addressed are:

- 1. Voice
- 2. Guest Voice
- 3. Softphone Voice
- 4. Video Conferencing
- 5. Streaming Video
- 6. Control / Signaling (conditionally support a separate network policy for the media types above)

A large network may support multiple VoIP policies across the entire organization, and different policies per application type. LLDP-MED allows multiple policies to be advertised per port, each corresponding to a different application type. Different ports on the same Network Connectivity Device may advertise different sets of policies, based on the authenticated user identity or port configuration.

It should be noted that LLDP-MED is not intended to run on links other than between Network Connectivity Devices and Endpoints, and therefore does not need to advertise the multitude of network policies that frequently run on an aggregated link interior to the LAN.

Ohiost	Description		
Object	Description		
• Delete	Check to delete the policy. It will be deleted during the next save.		
Policy ID	ID for the policy. This is auto generated and shall be used when selecting the		
	polices that shall be mapped to the specific ports.		
 Application Type 	Intended use of the application types:		
	■ Voice - for use by dedicated IP Telephony handsets and other similar		
	appliances supporting interactive voice services. These devices are		
	typically deployed on a separate VLAN for ease of deployment and		
	enhanced security by isolation from data applications.		
	■ Voice Signaling (conditional) - for use in network topologies that		
	require a different policy for the voice signaling than for the voice		
	media. This application type should not be advertised if all the same		
	network policies apply as those advertised in the Voice application		
	policy.		
	■ Guest Voice - support a separate 'limited feature-set' voice service for		
	guest users and visitors with their own IP Telephony handsets and		
	other similar appliances supporting interactive voice services.		
	■ Guest Voice Signaling (conditional) - for use in network topologies		
	that require a different policy for the guest voice signaling than for the		
	guest voice media. This application type should not be advertised if all		
	the same network policies apply as those advertised in the Guest		
	Voice application policy.		
	■ Softphone Voice - for use by softphone applications on typical data		
	centric devices, such as PCs or laptops. This class of endpoints		
	frequently does not support multiple VLANs, if at all, and are typically		
	configured to use an 'untagged' VLAN or a single 'tagged' data		
	specific VLAN. When a network policy is defined for use with an		
	'untagged' VLAN (see Tagged flag below), then the L2 priority field is		
	ignored and only the DSCP value has relevance.		
	■ Video Conferencing - for use by dedicated Video Conferencing		
	equipment and other similar appliances supporting real-time		
	interactive video/audio services.		
	■ Streaming Video - for use by broadcast or multicast based video		
	content distribution and other similar applications supporting		
	streaming video services that require specific network policy		
	treatment. Video applications relying on TCP with buffering would not		
	be an intended use of this application type.		
	■ Video Signaling (conditional) - for use in network topologies that		
	require a separate policy for the video signaling than for the video		
	media. This application type should not be advertised if all the same		

	network policies apply as those advertised in the Video Conferencing	
	application policy.	
• Tag	Tag indicating whether the specified application type is using a 'tagged' or an	
	'untagged' VLAN.	
	■ Untagged indicates that the device is using an untagged frame format	
	and as such does not include a tag header as defined by IEEE	
	802.1Q-2003. In this case, both the VLAN ID and the Layer 2 priority	
	fields are ignored and only the DSCP value has relevance.	
	■ Tagged indicates that the device is using the IEEE 802.1Q tagged	
	frame format, and that both the VLAN ID and the Layer 2 priority	
	values are being used, as well as the DSCP value. The tagged format	
	includes an additional field, known as the tag header. The tagged	
	frame format also includes priority tagged frames as defined by IEEE	
	802.1Q-2003.	
VLAN ID	VLAN identifier (VID) for the port as defined in IEEE 802.1Q-2003	
• L2 Priority	L2 Priority is the Layer 2 priority to be used for the specified application type. L2	
	Priority may specify one of eight priority levels (0 through 7), as defined by IEEE	
	802.1D-2004. A value of 0 represents use of the default priority as defined in	
	IEEE 802.1D-2004.	
• DSCP	DSCP value to be used to provide Diffserv node behavior for the specified	
	application type as defined in IETF RFC 2474. DSCP may contain one of 64	
	code point values (0 through 63). A value of 0 represents use of the default	
	DSCP value as defined in RFC 2475.	
Adding a new policy	Click Add New Policy to add a new policy. Specify the Application type,	
	Tag, VLAN ID, L2 Priority and DSCP for the new policy. Click "Save".	
	The number of policies supported is 32	

Port Policies Configuration

Every port may advertise a unique set of network policies or different attributes for the same network policies, based on the authenticated user identity or port configuration.

Object	Description	
• Port	The port number for which the configuration applies.	
Policy ID	The set of policies that shall apply for a given port. The set of policies is selected	
	by checkmarking the checkboxes that corresponds to the policies	

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.3.8.5 LLDP-MED Neighbor

This page provides a status overview for all LLDP-MED neighbors. The displayed table contains a row for each port on which an LLDP neighbor is detected. The LLDP-MED Neighbor Information screen in Figure 4-3-8-4 appears. The columns hold the following information:

LLDP-MED Neighbour Information					
	Port 1				
Device Type	Capabilities				
Endpoint Class III	LLDP-MED Capabilities, Network Policy, Extended Power via MDI - PD, Inventory				
Application Type	Policy	Tag	VLAN ID	Priority	DSCP
Voice	Defined	Untagged	-	-	46
Voice Signaling	Defined	Untagged	-	-	32
Auto-negotiation	Auto-negotiation status	Auto-negotiation Capabilities	MAU Type		
Supported	Enabled	1000BASE-T half duplex mode, 1000BASE-X, -LX, -SX, -CX full duplex mode, Asymmetric and Symmetric PAUSE for full-duplex links, Symmetric PAUSE for full-duplex links			

Figure 4-3-8-3: LLDP-MED Neighbor Information Page Screenshot

The page includes the following fields:

Fast start repeat count

Object	Description
• Port	The port on which the LLDP frame was received.
Device Type	LLDP-MED Devices are comprised of two primary Device Types: Network
	Connectivity Devices and Endpoint Devices.
	LLDP-MED Network Connectivity Device Definition
	LLDP-MED Network Connectivity Devices, as defined in TIA-1057, provide
	access to the IEEE 802 based LAN infrastructure for LLDP-MED Endpoint
	Devices. An LLDP-MED Network Connectivity Device is a LAN access device
	based on any of the following technologies:
	1. LAN Switch/Router
	2. IEEE 802.1 Bridge
	3. IEEE 802.3 Repeater (included for historical reasons)
	4. IEEE 802.11 Wireless Access Point
	5. Any device that supports the IEEE 802.1AB and MED extensions defined
	by TIA-1057 and can relay IEEE 802 frames via any method.
	LLDP-MED Endpoint Device Definition
	Within the LLDP-MED Endpoint Device category, the LLDP-MED scheme is
	broken into further Endpoint Device Classes, as defined in the following.
	Each LLDP-MED Endpoint Device Class is defined to build upon the capabilities
	defined for the previous Endpoint Device Class. Fore-example will any LLDP-
	MED Endpoint Device claiming compliance as a Media Endpoint (Class II) also
	support all aspects of TIA-1057 applicable to Generic Endpoints (Class I), and

any LLDP-MED Endpoint Device claiming compliance as a Communication

Device (Class III) will also support all aspects of TIA-1057 applicable to both

Media Endpoints (Class II) and Generic Endpoints (Class I).

LLDP-MED Generic Endpoint (Class I)

The LLDP-MED Generic Endpoint (Class I) definition is applicable to all endpoint products that require the base LLDP discovery services defined in TIA-1057, however do not support IP media or act as an end-user communication appliance. Such devices may include (but are not limited to) IP Communication Controllers, other communication related servers, or any device requiring basic services as defined in TIA-1057.

Discovery services defined in this class include LAN configuration, device location, network policy, power management, and inventory management.

LLDP-MED Media Endpoint (Class II)

The LLDP-MED Media Endpoint (Class II) definition is applicable to all endpoint products that have IP media capabilities however may or may not be associated with a particular end user. Capabilities include all of the capabilities defined for the previous Generic Endpoint Class (Class I), and are extended to include aspects related to media streaming. Example product categories expected to adhere to this class include (but are not limited to) Voice / Media Gateways, Conference Bridges, Media Servers, and similar.

Discovery services defined in this class include media-type-specific network layer policy discovery.

LLDP-MED Communication Endpoint (Class III)

The LLDP-MED Communication Endpoint (Class III) definition is applicable to all endpoint products that act as end user communication appliances supporting IP media. Capabilities include all of the capabilities defined for the previous Generic Endpoint (Class I) and Media Endpoint (Class II) classes, and are extended to include aspects related to end user devices. Example product categories expected to adhere to this class include (but are not limited to) end user communication appliances, such as IP Phones, PC-based softphones, or other communication appliances that directly support the end user.

Discovery services defined in this class include provision of location identifier (including ECS / E911 information), embedded L2 switch support, inventory

LLDP-MED Capabilities

 ${\tt LLDP\text{-}MED\ Capabilities\ describes\ the\ neighbor\ unit's\ LLDP\text{-}MED\ capabilities}.}$

The possible capabilities are:

management

- 1. LLDP-MED capabilities
- 2. Network Policy
- 3. Location Identification
- 4. Extended Power via MDI PSE

	5.5.1.1.B. : MDL DD
	5. Extended Power via MDI - PD
	6. Inventory
	7. Reserved
 Application Type 	Application Type indicating the primary function of the application(s) defined for
	this network policy, advertised by an Endpoint or Network Connectivity Device.
	The possible application types are shown below.
	■ Voice - for use by dedicated IP Telephony handsets and other similar
	appliances supporting interactive voice services. These devices are typically
	deployed on a separate VLAN for ease of deployment and enhanced
	security by isolation from data applications.
	■ Voice Signaling - for use in network topologies that require a different
	policy for the voice signaling than for the voice media.
	■ Guest Voice - to support a separate limited feature-set voice service for
	guest users and visitors with their own IP Telephony handsets and other
	similar appliances supporting interactive voice services.
	■ Guest Voice Signaling - for use in network topologies that require a different
	policy for the guest voice signaling than for the guest voice media.
	■ Softphone Voice - for use by softphone applications on typical data centric
	devices, such as PCs or laptops.
	■ Video Conferencing - for use by dedicated Video Conferencing equipment
	and other similar appliances supporting real-time interactive video/audio
	services.
	■ Streaming Video - for use by broadcast or multicast based video content
	distribution and other similar applications supporting streaming video
	services that require specific network policy treatment. Video applications
	relying on TCP with buffering would not be an intended use of this
	application type.
	■ Video Signaling - for use in network topologies that require a separate
	policy for the video signaling than for the video media.
Policy	Policy indicates that an Endpoint Device wants to explicitly advertise that the
•	policy is required by the device. Can be either Defined or Unknown
	■ Unknown: The network policy for the specified application type is currently
	unknown.
	■ Defined : The network policy is defined.
• TAG	TAG is indicating whether the specified application type is using a tagged or an
-	untagged VLAN. Can be Tagged or Untagged
	■ Untagged: The device is using an untagged frame format and as such does
	not include a tag header as defined by IEEE 802.1Q-2003.
	■ Tagged: The device is using the IEEE 802.1Q tagged frame format
VLAN ID	VLAN ID is the VLAN identifier (VID) for the port as defined in IEEE 802.1Q-
- VLANIU	VENTA ID 13 the VENTA Identifier (VID) for the port as defined in IEEE 002. IQ-

	2003. A value of 1 through 4094 is used to define a valid VLAN ID. A value of 0
	(Priority Tagged) is used if the device is using priority tagged frames as defined
	by IEEE 802.1Q-2003, meaning that only the IEEE 802.1D priority level is
	significant and the default PVID of the ingress port is used instead.
• Priority	Priority is the Layer 2 priority to be used for the specified application type. One
	of eight priority levels (0 through 7)
• DSCP	DSCP is the DSCP value to be used to provide Diffserv node behavior for the
	specified application type as defined in IETF RFC 2474. Contain one of 64 code
	point values (0 through 63).
Auto-negotiation	Auto-negotiation identifies if MAC/PHY auto-negotiation is supported by the
	link partner.
Auto-negotiation	Auto-negotiation status identifies if auto-negotiation is currently enabled at the
status	link partner. If Auto-negotiation is supported and Auto-negotiation status is
	disabled, the 802.3 PMD operating mode will be determined the operational
	MAU type field value rather than by auto-negotiation.
Auto-negotiation	Auto-negotiation Capabilities shows the link partners MAC/PHY capabilities.
Capabilities	

Buttons

Refresh: Click to refresh the page immediately.
Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

4.3.8.6 Port Statistics

This page provides an overview of all LLDP traffic. Two types of counters are shown. Global counters are counters that refer to the whole switch, while local counters refers to counters for the currently selected switch. The LLDP Statistics screen in Figure 4-3-8-5 appears.

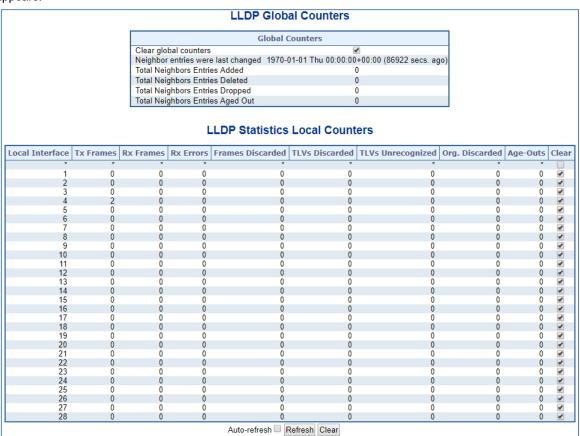

Figure 4-3-8-5: LLDP Statistics Page Screenshot

The page includes the following fields:

Global Counters

Object	Description	
Clear global counters	If checked the global counters are cleared when Clear is pressed.	
Neighbor entries were	It also shows the time when the last entry was last deleted or added. It also	
last changed	shows the time elapsed since the last change was detected.	
Total Neighbors	Shows the number of new entries added since switch reboot.	
Entries Added		
Total Neighbors	Shows the number of new entries deleted since switch reboot.	
Entries Deleted		
Total Neighbors	Shows the number of LLDP frames dropped due to that the entry table was full.	
Entries Dropped		
Total Neighbors	Shows the number of entries deleted due to Time-To-Live expiring.	
Entries Aged Out		

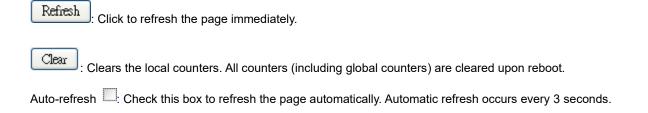

LLDP Statistics Local Counters

The displayed table contains a row for each port. The columns hold the following information:

Object	Description	
Local Port	The port on which LLDP frames are received or transmitted.	
Tx Frames	The number of LLDP frames transmitted on the port.	
Rx Frames	The number of LLDP frames received on the port.	
Rx Errors	The number of received LLDP frames containing some kind of error.	
Frames Discarded	If an LLDP frame is received on a port, and the switch's internal table has run	
	full, the LLDP frame is counted and discarded. This situation is known as "Too	
	Many Neighbors" in the LLDP standard. LLDP frames require a new entry in the	
	table when the Chassis ID or Remote Port ID is not already contained within the	
	table. Entries are removed from the table when a given port links down, an	
	LLDP shutdown frame is received, or when the entry ages out.	
TLVs Discarded	Each LLDP frame can contain multiple pieces of information, known as TLVs	
	(TLV is short for "Type Length Value"). If a TLV is malformed, it is counted and	
	discarded.	
• TLVs Unrecognized	The number of well-formed TLVs, but with an unknown type value.	
Org. Discarded	The number of organizationally TLVs received.	
Age-Outs	Each LLDP frame contains information about how long time the LLDP	
	information is valid (age-out time). If no new LLDP frame is received within the	
	age out time, the LLDP information is removed, and the Age-Out counter is	
	incremented.	

Buttons

4.3.9 MAC Address Table

Switching of frames is based upon the DMAC address contained in the frame. The **Industrial Managed Switch** builds up a table that maps MAC addresses to switch ports for knowing which ports the frames should go to (based upon the DMAC address in the frame). This table contains both static and dynamic entries. The static entries are configured by the network administrator if the administrator wants to do a fixed mapping between the DMAC address and switch ports.

The frames also contain a MAC address (SMAC address), which shows the MAC address of the equipment sending the frame. The SMAC address is used by the switch to automatically update the MAC table with these dynamic MAC addresses. Dynamic entries are removed from the MAC table if no frame with the corresponding SMAC address have been seen after a configurable age time.

4.3.9.1 MAC Table Configuration

The MAC Address Table is configured on this page. Set timeouts for entries in the dynamic MAC Table and configure the static MAC table here. The MAC Address Table Configuration screen in Figure 4-3-9-1 appears.

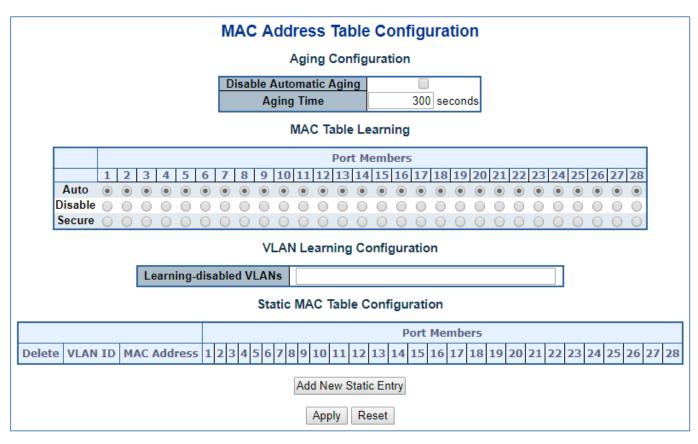

Figure 4-3-9-1: MAC Address Table Configuration Page Screenshot

The page includes the following fields:

Aging Configuration

By default, dynamic entries are removed from the MAC table after 300 seconds. This removal is also called aging.

Object	Description
• Disable	Enables/disables the automatic aging of dynamic entries
Automatic Aging	
Aging Time	The time after which a learned entry is discarded. By default, dynamic entries are
	removed from the MAC after 300 seconds. This removal is also called aging.
	(Range: 10-10000000 seconds; Default: 300 seconds)

MAC Table Learning

If the learning mode for a given port is grayed out, another module is in control of the mode, so that it cannot be changed by the user. An example of such a module is the MAC-Based Authentication under 802.1X.

Object	Description	
• Auto	Learning is done automatically as soon as a frame with unknown SMAC is received.	
• Disable	No learning is done.	
Secure	Only static MAC entries are learned, all other frames are dropped.	
	Note: Make sure that the link used for managing the switch is added to the Static Mac	
	Table before changing to secure learning mode, otherwise the management link is lost	
	and can only be restored by using another non-secure port or by connecting to the switch	
	via the serial interface.	

Static MAC Table Configuration

The static entries in the MAC table are shown in this table. The static MAC table can contain 64 entries. The MAC table is sorted first by VLAN ID and then by MAC address.

Object	Description	
• Delete	Check to delete the entry. It will be deleted during the next save.	
VLAN ID	The VLAN ID of the entry.	
MAC Address	The MAC address of the entry.	
Port Members	Checkmarks indicate which ports are members of the entry. Check or uncheck as	
	needed to modify the entry.	
Adding a New Static Entry	Click Add New Static Entry to add a new entry to the static MAC table. Specify the VLAN ID, MAC address, and port members for the new entry. Click "Save".	

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.3.9.2 MAC Address Table Status

Dynamic MAC Table

Entries in the MAC Table are shown on this page. The MAC Table contains up to **8192** entries, and is sorted first by VLAN ID, then by MAC address. The MAC Address Table screen in Figure 4-3-9-2 appears.

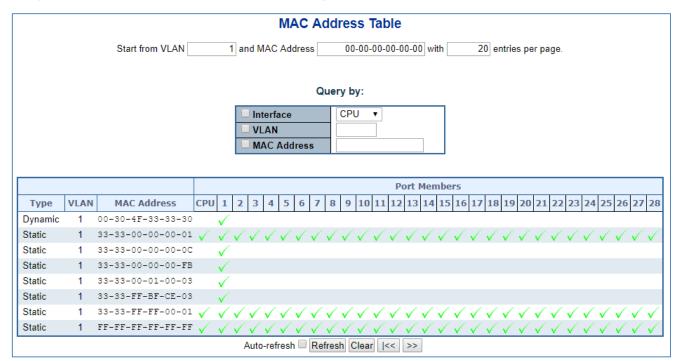

Figure 4-3-9-2: MAC Address Table Status Page Screenshot

Navigating the MAC Table

Each page shows up to 999 entries from the MAC table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MAC Table. The first displayed will be the one with the lowest VLAN ID and the lowest MAC address found in the MAC Table.

The "Start from MAC address" and "VLAN" input fields allow the user to select the starting point in the MAC Table.

Clicking the "Refresh" button will update the displayed table starting from that or the closest next MAC Table match.

In addition, the two input fields will - upon a "**Refresh**" button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

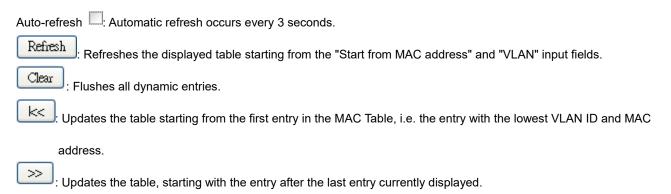

The ">>" will use the last entry of the currently displayed VLAN/MAC address pairs as a basis for the next lookup. When the end is reached the text "no more entries" is shown in the displayed table. Use the "|<<" button to start over.

The page includes the following fields:

Object	Description
• Type	Indicates whether the entry is a static or dynamic entry.
• VLAN	The VLAN ID of the entry.
MAC Address	The MAC address of the entry.
Port Members	The ports that are members of the entry.

Buttons

4.3.10 Loop Protection

This chapter describes enabling loop protection function that provides loop protection to prevent broadcast loops in **Industrial**Managed Switch.

4.3.10.1 Configuration

This page allows the user to inspect the current Loop Protection configurations, and possibly change them as well as screen in Figure 4-3-10-1 appears.

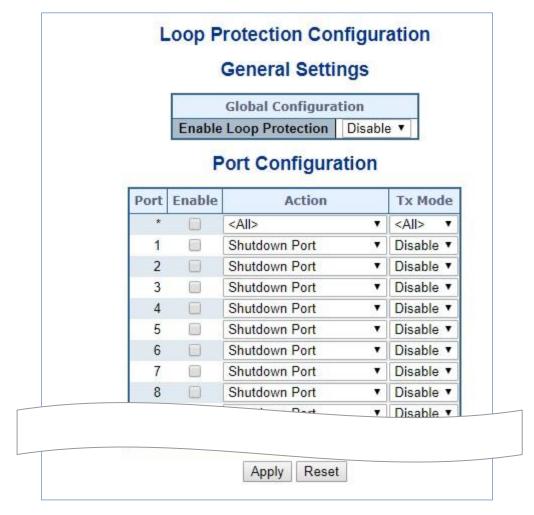

Figure 4-3-10-1: Loop Protection Configuration Page Screenshot

The page includes the following fields:

General Settings

Object	Description
Enable Loop	Controls whether loop protection is enabled (as a whole).
Protection	

Port Configuration

Object	Description	
• Port	The switch port number of the port.	
• Enable	Controls whether loop protection is enabled on this switch port.	
• Action	Configures the action performed when a loop is detected on a port. Valid values	
	are Shutdown Port, Shutdown Port and Log or Log Only.	
Tx Mode	Controls whether the port is actively generating loop protection PDU's, or	
	whether it is just passively looking for looped PDU's.	

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.3.10.2 Loop Protection Status

This page displays the loop protection port status of the switch; screen in Figure 4-3-10-2 appears.

Figure 4-3-10-2: Loop Protection Status Screenshot

The page includes the following fields:

Object	Description	
• Port	The Industrial Managed Switch port number of the logical port.	
• Action	The currently configured port action.	
• Transmit	The currently configured port transmit mode.	
• Loops	The number of loops detected on this port.	
• Status	The current loop protection status of the port.	
• Loop	Whether a loop is currently detected on the port.	
Time of Last Loop	The time of the last loop event detected.	

Buttons

4.3.11 UDLD

Unidirectional Link Detection (UDLD) is a data link layer protocol from Cisco Systems to monitor the physical configuration of the cables and detect unidirectional links. UDLD complements the Spanning Tree Protocol which is used to eliminate switching loops..

4.3.11.1 UDLD Port Configuration

This page allows the user to inspect the current UDLDconfigurations, and possibly change them as well. as screen in Figure 4-3-11-1 appears.

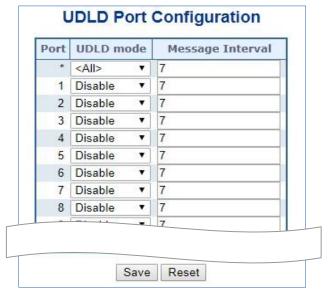

Figure 4-3-11-1: UDLD Configuration Page Screenshot

The page includes the following fields:

General Settings

Object	Description	
• Port	Port number of the switch.	
UDLD Mode	Configures the <u>UDLD</u> mode on a port. Valid values	
	are Disable, Normal and Aggressive. Default mode is Disable.	
	Disable : In disabled mode, UDLD functionality doesn't exists on port	
	Normal: In normal mode, if the link state of the port was determined to be	
	unidirectional, it will not affect the port state.	
	Aggressive: In aggressive mode, unidirectional detected ports will get	
	shutdown. To bring back the ports up, need to disable <u>UDLD</u> on that port	
Message Interval	Configures the period of time between <u>UDLD</u> probe messages on ports that are	
	in the advertisement phase and are determined to be bidirectional. The range is	
	from 7 to 90 seconds(Default value is 7 seconds)(Currently default time interval	
	is supported, due to lack of detailed information in RFC 5171).

4.3.11.2 UDLD Status

This page displays the UDLD status of the ports as well. as screen in Figure 4-3-11-2 appears.

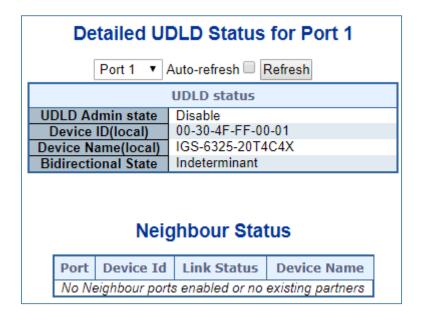

Figure 4-3-11-2: UDLD status Page Screenshot

The page includes the following fields:

UDLD port status

Object	Description	
UDLD Admin State	The current port state of the logical port, Enabled if any of	
	state(Normal,Aggressive) is Enabled.	
Device ID(local)	The ID of Device	
Device Name(local)	Name of the Device.	
Bidirectional State	The current state of the port.	

Neighbour Status

Object	Description
• Port	The current port of neighbour device
Device ID	The current ID of neighbour device.
Link Status	The current link status of neighbour port.
Device Name	Name of the Neighbour Device.

4.3.12 Link OAM

4.3.12.1 Statistics

This page provides detailed OAM traffic statistics for a specific switch port. Use the port select box to select which switch port details to display. The displayed counters represent the total number of OAM frames received and transmitted for the selected port. Discontinuities of these counter can occur at re-initialization of the management system. as screen in Figure 4-3-12-1 appears.

Port 1 V Auto-refree		sh Clear	
Receive Total		Transmit Total	
Rx OAM Information PDU's	0	Tx OAM Information PDU's	
Rx Unique Error Event Notification	0	Tx Unique Error Event Notification	
Rx Duplicate Error Event Notification	0	Tx Duplicate Error Event Notification	
Rx Loopback Control	0	Tx Loopback Control	
Rx Variable Request 0		Tx Variable Request	
Rx Variable Response 0		Tx Variable Response	
Rx Org Specific PDU's 0		Tx Org Specific PDU's	
Rx Unsupported Codes 0		Tx Unsupported Codes	
Rx Link Fault PDU's	0	Tx Link Fault PDU's	
Rx Dying Gasp	0	Tx Dying Gasp	
Rx Critical Event PDU's 0		Tx Critical Event PDU's	

Figure 4-3-12-1: Link OAM Statistic Page Screenshot

The page includes the following fields:

General Settings

Object	Description	
Rx and Tx OAM	The number of received and transmitted OAM Information PDU's.	
Information PDU's	Discontinuities of this counter can occur at re-initialization of the management	
	system.	
Rx and Tx Unique	A count of the number of unique Event OAMPDUs received and transmitted on	
Error Event	this interface. Event Notifications may be sent in duplicate to increase the	
Notification	probability of successfully being received, given the possibility that a frame may	
	be lost in transit. Duplicate Event Notification transmissions are counted by	
	Duplicate Event Notification counters for Tx and Rx respectively.	
	A unique Event Notification OAMPDU is indicated as an Event Notification	
	OAMPDU with a Sequence Number field that is distinct from the previously	
	transmitted Event Notification OAMPDU Sequence Number.	
Rx and Tx Duplicate	A count of the number of duplicate Event OAMPDUs received and transmitted	
Error Event	on this interface. Event Notification OAMPDUs may be sent in duplicate to	
Notification	increase the probability of successfully being received, given the possibility that	

	a frame may be lost in transit.
	A duplicate Event Notification OAMPDU is indicated as an Event Notification
	OAMPDU with a Sequence Number field that is identical to the previously
	transmitted Event Notification OAMPDU Sequence Number.
Rx and Tx Loopback	A count of the number of Loopback Control OAMPDUs received and transmitted
Control	on this interface.
Rx and Tx Variable	A count of the number of Variable Request OAMPDUs received and transmitted
Request	on this interface.
Rx and Tx Variable	A count of the number of Variable Response OAMPDUs received and
Response	transmitted on this interface.
Rx and Tx Org Specific	A count of the number of Organization Specific OAMPDUs transmitted on this
PDU's	interface.
• Rx and Tx	A count of the number of OAMPDUs transmitted on this interface with an
Unsupported Codes	unsupported op-code.
Rx and Tx Link fault	A count of the number of Link fault PDU's received and transmitted on this
PDU's	interface.
Rx and Tx Dying Gasp	A count of the number of Dying Gasp events received and transmitted on this
	interface.
Rx and Tx Critical	A count of the number of Critical event PDU's received and transmitted on this
Event PDU's	interface.

Buttons

Refresh: Click to refresh the page immediately.

Clear: : Clears the counters for the selected port.

4.3.12.2 Port Status

This page provides Link OAM configuration operational status. The displayed fields shows the active configuration status for the selected port. as well. as screen in Figure 4-3-12-2 appears.

Detailed Link OAM Status for Port 1

Local		Peer	
Mode	Passive	Mode	
Unidirectional Operation Support	Disabled	Unidirectional Operation Support	10
Remote Loopback Support	Disabled	Remote Loopback Support	
Link Monitoring Support	Enabled	Link Monitoring Support	
MIB Retrieval Support	Disabled	MIB Retrieval Support	
MTU Size	1500	MTU Size	
Multiplexer State	Forwarding	Multiplexer State	
Parser State	Forwarding	Parser State	
Organizational Unique Identification	a8-f7-e0	Organizational Unique Identification	
PDU Revision	0	PDU Revision	

Figure 4-3-12-2: Port Status Page Screenshot

The page includes the following fields:

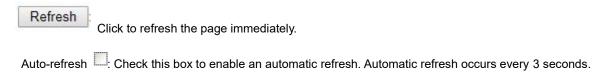

General Settings

Object	Description		
PDU Permission	This field is available only for the Local DTE.		
	It displays the current permission rules set for the local DTE. Possible values are		
	■ Link fault		
	■ Receive only		
	■ Information exchange only		
	■ ANY		
Discovery State	Displays the current state of the discovery process.		
	Possible states are		
	■ Fault state		
	■ Active state		
	■ Passive state		
	■ SEND_LOCAL_REMOTE_STATE		
	■ SEND_LOCAL_REMOTE_OK_STATE		
	■ SEND_ANY_STATE		
• Mode	The Mode in which the Link OAM is operating, Active or Passive.		

 Unidirectional 	This feature is not available to be configured by the user. The status of this
Operation Support	configuration is retrieved from the PHY.
Remote Loopback	If status is enabled, DTE is capable of OAM remote loopback mode.
Support	
Link Monitoring	If status is enabled, DTE supports interpreting Link Events.
Support	
MIB Retrieval Support	If status ie enabled DTE supports sending Variable Response OAMPDUs.
MTU Size	It represents the largest OAMPDU, in octets, supported by the DTE.
	This value is compared to the remotes Maximum PDU Size and the smaller of
	the two is used.
Multiplexer State	When in forwarding state, the Device is forwarding non-OAMPDUs to the lower
	sublayer. Incase of discarding, the device discards all the non-OAMPDU's.
Parser State	When in forwarding state, Device is forwarding non-OAMPDUs to higher
	sublayer.
	When in loopback , Device is looping back non-OAMPDUs to the lower
	sublayer.
	When in discarding state, Device is discarding non-OAMPDUs.
Organizational Unique	24-bit Organizationally Unique Identifier of the vendor.
Identification	
PDU Revision	It indicates the current revision of the Information TLV.
	The value of this field shall start at zero and be incremented each time
	something in the Information TLV changes. Upon reception of an Information
	TLV from a peer, an OAM client may use this field to decide if it needs to be
	processed (an Information TLV that is identical to the previous Information TLV
	doesn't need to be parsed as nothing in it has changed).

Buttons

4.3.12.4 Port Settings

This page allows the user to inspect the current Link OAM port configurations, and change them as well, as screen in Figure 4-3-12-4 appears.

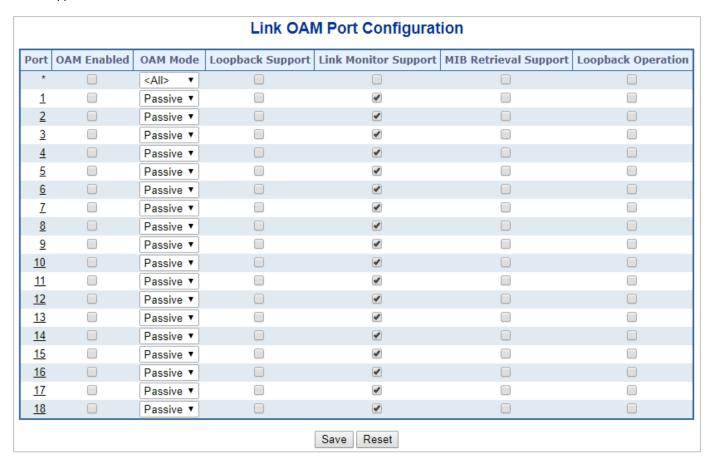

Figure 4-3-12-4: Port Status Page Screenshot

The page includes the following fields:

General Settings

Object	Description	
• Port	The switch port number.	
OAM Enabled	Controls whether Link OAM is enabled on this switch port. Enabling Link OAM	
	provides the network operators the ability to monitor the health of the network and	
	quickly determine the location of failing links or fault conditions.	
OAM Mode	Configures the OAM Mode as Active or Passive. The default mode is Passive.	
	■ Active mode	
	DTE's configured in Active mode initiate the exchange of Information	
	OAMPDUs as defined by the Discovery process. Once the Discovery	
	process completes, Active DTE's are permitted to send any OAMPDU while	
	connected to a remote OAM peer entity in Active mode. Active DTE's operate	
	in a limited respect if the remote OAM entity is operating in Passive mode.	
	Active devices should not respond to OAM remote loopback commands and	

	variable requests from a Passive peer.
	■ Passive mode
	DTE's configured in Passive mode do not initiate the Discovery process.
	Passive DTE's react to the initiation of the Discovery process by the remote
	DTE. This eliminates the possibility of passive to passive links. Passive
	DTE's shall not send Variable Request or Loopback Control OAMPDUs.
Loopback Support	Controls whether the loopback support is enabled for the switch port. Link OAM
	remote loopback can be used for fault localization and link performance testing.
	Enabling the loopback support will allow the DTE to execute the remote loopback
	command that helps in the fault detection.
Link Monitor Support	Controls whether the Link Monitor support is enabled for the switch port. On
	enabling the Link Monitor support, the DTE supports event notification that permits
	the inclusion of diagnostic information.
MIB Retrieval Support	Controls whether the MIB Retrieval Support is enabled for the switch port. On
	enabling the MIB retrieval support, the DTE supports polling of various Link OAM
	based MIB variables' contents.
Loopback Operation	If the Loopback support is enabled, enabling this field will start a loopback operation
	for the port.

4.3.12.5 Event Settings

This page allows the user to inspect the current Link OAM Link Event configurations, and change them as well, as screen in Figure 4-3-12-5 appears.

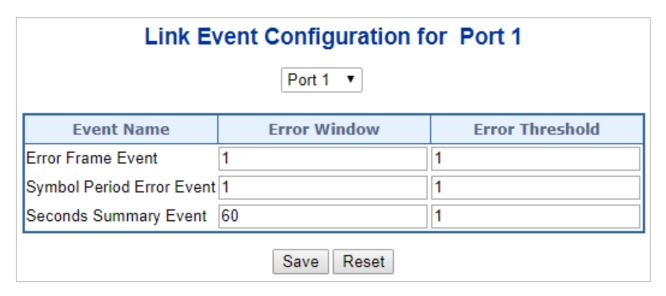

Figure 4-3-12-5: Event Settings Page Screenshot

The page includes the following fields:

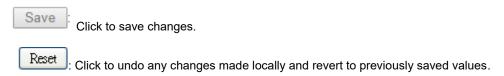

General Settings

Object	Description							
-	· · · ·							
• Port	The switch port number.							
Event Name	Name of the Link Event which is being configured.							
• Error Window	Represents the window period in the order of 1 sec for the observation of							
	various link events.							
• Error Threshold	Represents the threshold value for the window period for the appropriate Link							
	event so as to notify the peer of this error.							
• Error Frame Event	The Errored Frame Event counts the number of errored frames detected during							
	the specified period. The period is specified by a time interval (Window in order							
	of 1 sec). This event is generated if the errored frame count is equal to or							
	greater than the specified threshold for that period (Period Threshold). Errored							
	frames are frames that had transmission errors as detected at the Media Access							
	Control sublayer. Error Window for 'Error Frame Event' must be an integer value							
	between 1-60 and its default value is '1'. Whereas Error Threshold must be							
	between 0-4294967295 and its default value is '1'.							
Symbol Period Error	ved in a time interval on the underlying physical layer. This event is generated if							
Event	the symbol error count is equal to or greater than the specified threshold for that							
	period. Error Window for 'Symbol Period Error Event' must be an integer value							
	between 1-60 and its default value is '1'. Whereas Error Threshold must be							

	between 0-4294967295 and its default value is '1'.						
Seconds Summary	The Errored Frame Seconds Summary Event TLV counts the number of errored						
Event	frame seconds that occurred during the specified period. The period is specified						
	by a time interval. This event is generated if the number of errored frame						
	seconds is equal to or greater than the specified threshold for that period. An						
	errored frame second is a one second interval wherein at least one frame error						
	was detected. Errored frames are frames that had transmission errors as						
	detected at the Media Access Control sublayer. Error Window for 'Seconds						
	Summary Event' must be an integer value between 10-900 and its default value						
	is '60'. Whereas Error Threshold must be between 0-65535 and its default value						
	is '1'.						

Buttons

4.3.12.6 MIB Retrieval

Figure 4-3-13-2: CFM Domain Configuration

Object	Description						
• Delete	Check to delete the entry. It will be deleted during the next save.						
• Domain	Name of Domain. Value is a single word which begins with an alphabetic letter						
	A-Z or a-z with length 1-15.						
• Format	Select the MD name format. To mimic Y.1731 MEG IDs, use type None.						
	None						
	String						
• Name	The contents of this pamameter depends on the value of the format member.						
	If format is None : Name is not used, but will be set to all-zeros behind the						
	scenes. This format is typically used by Y.1731-kind-of-PDUs.						
	If format is String : Name must contain a string from 1 to 43 characters long.						

Level

MD/MEG level of this domain. Valid values are restricted to 0 - 7.

About leak prevention

Leak prevention is about discarding OAM PDUs with MEG levels lower than the MEP they hit when the OAM PDUs are ingressing the port on which the MEP resides, and to discard OAM PDUs with MEG levels at or lower than the MEP's when the OAM PDUs are ingressing other ports.

There are two categories of architectures, when it comes to leak-prevention:

Those that use Shared MEG level and those that use Independent MEG level:

Shared MEG level

On Shared MEG level architectures, Port Down MEPs always perform level filtering no matter which VLAN ID (VID) OAM PDUs get classified to, unless the same port has a VLAN MEP on the VID in question. So if you have a Port MEP in VID X and a VLAN MEP in VID Y, an OAM frame arriving on the port and gets classified to VID X or VID Z will be handled/level-filtered by the Port MEP, whereas an OAM frame ingressing the port in VID Y will be handled by the VLAN MEP. Likewise, if the switch has a Port MEP on VID X on Port X and an OAM frame ingresses on VID Y on Port Y, it is subject to level filtering before egressing Port X, unless Port X also has a VLAN MEP on VID Y, in which case the VLAN MEP will take care of level-filtering the OAM PDU.

On Shared MEG level architectures, all Port MEPs must have the same MEG level and any VLAN MEP must have a MEG level higher than the Port MEPs' MEG level.

Independent MEG level

On Independent MEG level architectures, Port Down MEPs never perform level filtering on frames not classified to the MEP's VID. So if you have a Port MEP on VID X and a VLAN MEP on VID Y and an OAM frame ingresses any port on VID Z, it is not subject to handling/level-filtering by any of the two MEPs.

This switch exhibits Independent MEG level.

• TLV option select

Sender Id: Default Sender ID TLV format to be used in CCMs generated by this Domain (may be overridden in service)

None Do not include Sender ID TLVs.

Chassis Enable Sender ID TLV and send Chassis ID (MAC Address).

Manage Enable Sender ID TLV and send Management address (IPv4 Address).

ChassisManage Enable Sender ID TLV and send both Chassis ID (MAC Address) and Management Address (IPv4 Address).

Defer Let the global configuration decide if Sender ID TLVs shall be included (may be overridden in service).

Port Status: Include or exclude Port Status TLV in CCMs generated by this Domain or let higher level determine (may be overridden in Service).

Disable Do not include Port Status TLVs.

Enable Include Port Status TLVs.

Defer Let the global configuration decide if Port Status TLVs shall be included (may be overridden in Service).

Interface Status: Include or exclude Interface Status TLV in CCMs generated by this Domain or let higher level determine (may be overridden in Service).

Disable Do not include Interface Status TLVs.

Enable Include Interface Status TLVs.

Defer Let the global configuration decide if Interface Status TLVs shall be included (may be overridden in Service).

Org. Specific: Exclude Organization-Specific TLV in CCMs generated by this Domain or let higher level determine (may be overridden in Service).

Disable Do not include Organization-Specific TLVs.

Defer Let the global configuration decide if Organization-Specific TLVs shall be included (may be overridden in Service).

Figure 4-3-13-3: CFM Service Configuration

Configure CFM Service parameters on this page.

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Domain	Name of Domain under which this Service resides.
• Service	Name of Service. Value is a single word which begins with an alphabetic letter
	A-Z or a-z with length 1-15.
• Format	Select the short Service name format. This decides how the value of the Name
	parameter will be interpreted. To mimic Y.1731 MEG IDs, create an MD instance
	with an empty name and use Y1731 ICC or Y1731 ICC CC.
	Possible values are:
	String
	Two Octets
	Y1731 ICC
	Y1731 ICC CC
	Look under Name for explanation.
• Name	The contents of this parameter depends on the value of the format member.
	Besides the limitations explained for each of them, the following applies in
	general:
	If the Domain Format is None , the size of this cannot exceed 45 bytes.
	If the Domain Format is not None , the size of this cannot exceed 44 bytes.
	If Format is String, the following applies:
	length must be in range [1; 44]
	Contents must be in range [32; 126]
	If Format is Two Octets, the following applies: Name[0] and Name[1] will both

be interpreted as unsigned 8-bit integers (allowing a range of [0; 255]). Name[0] will be placed in the PDU before Name[1]. The remaining available bytes in name will not be used. If Format is Y1731 ICC, the following applies: length must be 13. Contents must be in range [a-z,A-Z,0-9] Y.1731 specifies that it is a concatenation of ICC (ITU Carrier Code) and UMC (Unique MEG ID Code): ICC: 1-6 bytes UMC: 7-12 bytes In principle UMC can be any value in range [1; 127], but this API does not allow for specifying length of ICC, so the underlying code doesn't know where ICC ends and UMC starts. The Domain Format must be None. If Format is Y1731 ICC CC, the following applies: length must be 15. First 2 chars (CC): Must be amongst [A-Z] Next 1-6 chars (ICC): Must be amongst [a-z,A-Z,0-9] Next 7-12 chars (UMC): Must be amongst [a-z,A-Z,0-9] There may be ONE (slash) present in name[3-7]. The Domain format must be None. VLAN The MA's primary VID. A primary VID of 0 means that all MEPs created within this MA will be created as port MEPs (interface MEPs). There can only be one port MEP per interface. A given port MEP may still be created with tags, if that MEP's VLAN is non-zero." A non-zero primary VID means that all MEPs created within this MA will be created as VLAN MEPs. A given MEP may be configured with another VLAN than the MA's primary VID, but it is impossible to have untagged VLAN MEPs. CCM Interval The CCM rate of all MEPs bound to this Service. TLV Option Select Sender Id: Default Sender ID TLV format to be used in CCMs generated by this Service. None Do not include Sender ID TLVs. Chassis Enable Sender ID TLV and send Chassis ID (MAC Address). Manage Enable Sender ID TLV and send Management address (IPv4 Address). ChassisManage Enable Sender ID TLV and send both Chassis ID (MAC Address) and Management Address (IPv4 Address). **Defer** Let the Domain configuration decide if Sender ID TLVs shall be included.

Port Status: Include or exclude Port Status TLV in CCMs generated by this Service or let higher level determine.

Disable Do not include Port Status TLVs.

Enable Include Port Status TLVs.

Defer Let the Domain configuration decide if Port Status TLVs shall be included.

Interface Status: Include or exclude Interface Status TLV in CCMs generated by this Service or let higher level determine.

Disable Do not include Interface Status TLVs.

Enable Include Interface Status TLVs.

Defer Let the Domain configuration decide if Interface Status TLVs shall be included.

Org. Specific: Exclude Organization-Specific TLV in CCMs generated by this Service or let higher level determine.

Disable Do not include Organization-Specific TLVs.

Defer Let the Domain configuration decide if Organization-Specific TLVs shall be included.

Buttons

Add New Entry: Click to add Flow Meter entry.

Apply: Click to apply changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

4.3.13.4 MEP

This switch supports two types of MEP: Port Down-MEPs and VLAN Down-MEPs.

Port Down-MEPs

In 802.1Q terminology, Port MEPs are located below the EISS entity, that is, closest to the physical port. Port MEPs are used by e.g. APS for protection purposes.

Port MEPs are created when the encompassing service has type "Port".

Port MEPs may send OAM PDUs tagged or untagged. An OAM PDU will be sent untagged only if the MEP's VLAN is set to "Inherit" (0). Any other value will cause it to be sent tagged with the port's TPID, whether or not the VLAN matches the port's PVID and that PVID is meant to be sent untagged.

VLAN Down-MEPs

in 802.1Q terminology, VLAN MEPs are located above the EISS entity.

This means that tagging of OAM PDUs will follow the port's VLAN configuration.

Thus, if a VLAN MEP is created on the Port's PVID and PVID is configured to be untagged, OAM PDUs will be transmitted untagged.

VLAN MEPs are created when the encompassing service has type "VLAN".

Down-MEP creation rules

There are a few rules to obey when creating Down-MEPs:

- 1. There can only be one Port MEP on the same port.
- 2. There can only be one VLAN MEP on the same port and VLAN.
- 3. A VLAN MEP must have a higher MD/MEG level than a Port MEP on the same port and VLAN.

These checks are performed automatically on administratively enabled MEPs when you change a particular MEP, change the Service Type from Port to VLAN or vice versa, or change the domain's MD/MEG level.

CFM Mep Configuration

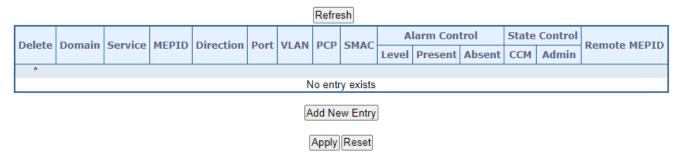

Figure 4-3-13-4: CFM MEP Configuration

The following explains the settings when configuring the MEP.

Object	Description							
Delete	Check to delete the entry. It will be deleted during the next save.							
	<u> </u>							
• Domain	Name of Domain under which this Service resides.							
Name	Name of Service under which this MEP resides.							
MEPID	The identification of this MEP. Must be an integer [18091]							
• Direction	Set whether this MEP is an Up- or a Down-MEP.							
• Port	Port on which this MEP resides.							
• VLAN	VLAN ID. Use the value 0 to indicate untagged traffic (implies a port MEP)							
• PCP	Choose PCP value in PDUs' VLAN tag. Not used if untagged.							
• SMAC	Set a Source MAC address to be used in CCM PDUs originating at this MEP.							
	Must be a unicast address. Format is XX:XX:XX:XX:XX. If all-zeros, the							
	switch port's MAC address will be used instead.							
Alarm Control	Level: If a defect is detected with a priority higher than this level, a fault alarm							
	notification will be generated.							
	Valid range is [1; 6] with 1 indicating that any defect will cause a fault alarm and							
	6 indicating that no defect can cause a fault alarm. See 802.1Q-2018, clause							
	20.9.5, LowestAlarmPri							
	The possible defects and their priorities are:							
	Short name Description Priority							
	DefRDICCM Remote Defect Indication 1							
	DefMACstatus MAC Status 2							
	DefRemoteCCM Remote CCM 3							
	DefErrorCCM Error CCM Received 4							
	DefXconCCM Cross Connect CCM Received 5							
	Present: The time in milliseconds that defects must be present before a fault							
	alarm notification is issued. Default is 2500 ms.							
	Absent: The time in milliseconds that defects must be absent before a fault							
	alarm notification is reset. Default is 10000 ms.							
State Control	CCM: Enable or disable generation of continuity-check messages (CCMs)							
	Admin: Enable or disable this MEP. When this MEP is enabled, it will check							
	received/missing CCMs and can raise defects.							
Remote MEPID	Specify the Remote MEP that this MEP is expected to receive CCM PDUs from.							
	Must be an integer [08091] where 0 means undefined. The value of Remote							
	MEPID must be different from the value of MEPID.

Ohioot	Description						
Object	Description						
• Domain	Name of Domain under which this Service resides.						
Service	Name of Service under which this MEP resides.						
• MEPID	The identification of this MEP. Must be an integer [18091]						
• Port	Port on which this MEP resides.						
• State	Active Operational state of the MEP.						
	: OFF. This indicates that the MEP Admin State is disabled.						
	: DOWN. The MEP Admin State is enabled, but an error state exists.						
	: UP. The MEP Admin State is enabled, and no errors and defects exists.						
	Fng: Holds the current state of the Fault Notification Generator State Machin						
	Values will be one of the following:						
	state Description						
	No defect has been present since reset timer expired or the						
	reset State Machine was last reset.						
	A defect is present, but not for a long enough time to be						
	defect reported.						
	reportDefect A transient state during which the defect is reported.						
	defectReported A defect is present, and some defect has been reported.						
	No defect is present, but the ResetTime timer has not yet						
	defectClearing expired.						
• SMAC	This MEP's MAC address.						
• Defects	Highest Highest priority defect that has been present since the MEP's fault						
	notification generator state machine was last in the reset state.						
	Defects: A MEP can detect and report a number of defects, and multiple						
	defects can be present at the same time. This is indicated the following letter						
	code.						

	Code	Defect	Description					
	-	Defect not present	Defect not present					
	R	someRDIdefect	RDI received from at least one remote MEP					
	М	someMACstatusDefect	Received Port Status TLV != psUp or Interface					
	IVI	SomewacstatusDefect	Status TLV != isUp					
	С	someRMFPCCMdefect	Valid CCM is not received within 3.5 times CCM					
	O	Somerwill Condender	interval from at least one remote MEP					
	E	errorCCMdefect	Received CCM from an unknown remote MEP-					
	_	CITOTOOMACTCOL	ID or CCM interval mismatch					
			Received CCM with an MD/MEG level smaller					
	X	xconCCMdefect	than configured or wrong MAID/MEGID (cross-					
			connect)					
• CCM Rx	Valid:	Total number of CCMs	that hit this MEP and passed the validation test.					
	Invali	d: Total number of CCM	s that hit this MEP and didn't pass the validation					
	test.							
	Errors	s: Total number of out-of	-sequence errors seen from RMEPs.					
• CCM Tx	Total r	Total number of CCM PDUs transmitted by this MEP.

4.3.14 sFlow (Only applies to switches installed with firmware after v1.2112bxxxxxx)

4.3.14.1 sFlow Configuration

This page allows for configuring <u>sFlow</u>. The configuration is divided into two parts: Configuration of the sFlow receiver (a.k.a. sFlow collector) and configuration of per-port flow and counter samplers.

sFlow configuration is not persisted to non-volatile memory, which means that a reboot will disable sFlow sampling.

Refresh

sFlow Configuration

Agent Configuration

IP Address 127.0.0.1

5		0	128		0
6		0	128		0

Figure 4-3-14-1: sFlow Configuration

Reset

Save

The following explains how tp configure the sFlow.

Agent Configuration

Object	Description	
• IP Address	The IP address used as Agent IP address in sFlow datagrams. It serves as a	
	unique key that will identify this agent over extended periods of time.	
	Both IPv4 and IPv6 addresses are supported.	

Receiver Configuration

Object	Description	
• Onwer	Basically, sFlow can be configured in two ways: Through local management	
	using the Web or CLI interface or through SNMP. This read-only field shows the	
	owner of the current sFlow configuration and assumes values as follows:	
	If sFlow is currently unconfigured/unclaimed, Owner contains <none>.</none>	
	If sFlow is currently configured through Web or CLI, Owner	
	contains <configured local="" management="" through="">.</configured>	
	If sFlow is currently configured through SNMP, Owner contains a string	
	identifying the sFlow receiver.	
	If sFlow is configured through SNMP, all controls - except for the Release-button	
	- are disabled to avoid inadvertent reconfiguration.	
	The button allows for releasing the current owner and disable sFlow sampling.	
	The button is disabled if sFlow is currently unclaimed. If configured through	
	SNMP, the release must be confirmed (a confirmation request will appear).	
• IP Address/Hostname	The IP address or hostname of the sFlow receiver. Both IPv4 and IPv6	
	addresses are supported.	
• UDP Port	The <u>UDP</u> port on which the sFlow receiver listens to sFlow datagrams. If set to 0	
	(zero), the default port (6343) is used.	
• Timeout	The number of seconds remaining before sampling stops and the current sFlow	
	owner is released. While active, the current time left can be updated with a click	
	on the Refresh-button. If locally managed, the timeout can be changed on the fly	
	without affecting any other settings. Valid range is 0 to 2147483647 seconds.	
Max. Datagram Size	The maximum number of data bytes that can be sent in a single sample	
	datagram. This should be set to a value that avoids fragmentation of the sFlow	
	datagrams. Valid range is 200 to 1468 bytes with default being 1400 bytes.	

Port Configuration

Object	Description
• Port	The port number for which the configuration below applies.
Flow Sampler Enabled	Enables/disables flow sampling on this port.
Flow Sampler	The statistical sampling rate for packet sampling. Set to N to sample on average
Sampling Rate	1/Nth of the packets transmitted/received on the port.
	Not all sampling rates are achievable. If an unsupported sampling rate is
	requested, the switch will automatically adjust it to the closest achievable. This
	will be reported back in this field. Valid range is 1 to 32767.
Flow Sampler Max.	The maximum number of bytes that should be copied from a sampled packet to
Header	the sFlow datagram. Valid range is 14 to 200 bytes with default being 128 bytes.
	To have room for any frame, the <u>maximum datagram size</u> should be roughly 100
	bytes larger than the maximum header size. If the maximum datagram size does
	not take into account the maximum header size, samples may be dropped.
Counter Poller	Enables/disables counter polling on this port.
Enabled	
Counter Poller Interval	With counter polling enabled, this specifies the interval - in seconds - between
	counter poller samples. Valid range is 1 to 3600 seconds.

Buttons

Release : See description under Owner.

Refresh: Click to refresh the page. Note that unsaved changes will be lost.

Apply: Click to apply changes. Note that sFlow configuration is not persisted to non-volatile memory.

Reset: Click to undo any changes made locally and revert to previously saved values.

4.3.14.2 sFlow Statistics

5	0	0
6	0	0

Figure 4-3-14-2: sFlow Statistics

Receiver Statistics

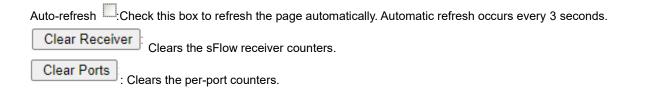

Object	Description
• Owner	This field shows the current owner of the sFlow configuration. It assumes one of
	three values as follows:
	• If sFlow is currently unconfigured/unclaimed, Owner contains <none>.</none>
	If sFlow is currently configured through Web or CLI, Owner
	contains < Configured through local management>.
	If sFlow is currently configured through SNMP, Owner contains a string
	identifying the sFlow receiver.
IP Address/Hostname	The IP address or hostname of the sFlow receiver.
• Timeout	The number of seconds remaining before sampling stops and the current sFlow
	owner is released.
Tx Successes	The number of UDP datagrams successfully sent to the sFlow receiver.
• Tx Errors	The number of UDP datagrams that has failed transmission.
	The most common source of errors is invalid sFlow receiver
	IP/hostname configuration. To diagnose, paste the receiver's IP
	address/hostname into the Ping Web page (Diagnostics → Ping/Ping6).
Flow Samples	The total number of flow samples sent to the sFlow receiver.
Counter Samples	The total number of counter samples sent to the sFlow receiver.

Port Statistics

Object	Description
• Port	The port number for which the following statistics applies.
• Flow Samples	The number of flow samples sent to the sFlow receiver originating from this port.
Counter Samples	The total number of counter samples sent to the sFlow receiver originating from
	this port.

Buttons

4.3.15 PTP

The **Precision Time Protocol** (**PTP**) is a protocol used to synchronize clocks throughout a computer network. On a local area network, it achieves clock accuracy in the sub-microsecond range, making it suitable for measurement and control systems. PTP was originally defined in the **IEEE 1588-2002** standard, officially entitled "Standard for a Precision Clock Synchronization Protocol for Networked Measurement and Control Systems" and published in 2002. In 2008 a revised standard, **IEEE 588-2008** was released. This new version, also known as PTP Version 2, improves accuracy, precision and robustness but is not backwards compatible with the original 2002 version.

"IEEE 1588 is designed to fill a niche not well served by either of the two dominant protocols, **NTP** and **GPS**. IEEE 1588 is designed for local systems requiring accuracies beyond those attainable using NTP. It is also designed for applications that cannot bear the cost of a GPS receiver at each node, or for which GPS signals are inaccessible"

4.3.15.1 PTP Configuration

This page allows the user to configure and inspect the current PTP clock settings. as screen in Figure 4-3-15-1 appears.

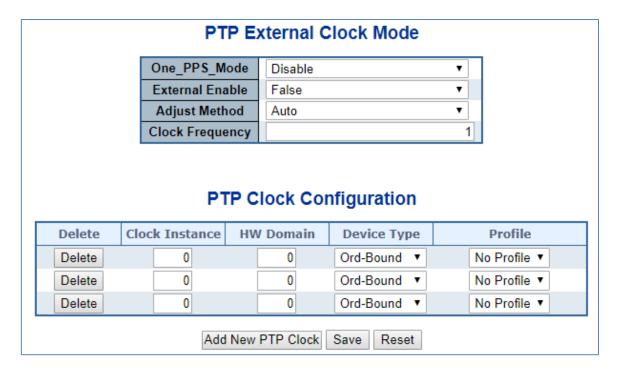

Figure 4-3-15-1: PTP Configuration Page Screenshot

The page includes the following fields:

General Settings

Object	Description	
One_PPS_Mode	This Selection box will allow you to select the One_pps_mode configuration.	
	The following values are possible:	
	Output : Enable the 1 pps clock output.	
	■ Input : Enable the 1 pps clock input.	
	■ Disable : Disable the 1 pps clock in/out-put.	
External Enable	This Selection box will allow you to configure the External Clock output.	
	The following values are possible:	
	■ True : Enable the external clock output.	
	■ False : Disable the external clock output.	
Adjust Method	This Selection box will allow you to configure the Frequency adjustment	
	configuration.	
	■ LTC : Select Local Time Counter (LTC) frequency control.	
	■ Single : Select SyncE DPLL frequency control, if allowed by SyncE.	
	■ Independent : Select an oscillator independent of SyncE for frequency	
	control, if supported by the HW.	
	■ Common : Select second DPLL for PTP, Both DPLL have the same	
	(SyncE recovered) clock.	
	■ Auto : AUTO Select clock control, based on PTP profile and available HW	
	resources.	
 Clock Frequency 	This will allow to set the Clock Frequency.	
	The possible range of values are 1 - 25000000 (1 - 25MHz)	
• Delete	Check this box and click on 'Save' to delete the clock instance.	
Clock Instance	Indicates the Instance of a particular Clock Instance [03].	
	Click on the Clock Instance number to edit the Clock details	
HW Domain	Indicates the HW clock domain used by the clock.	
Device Type	Indicates the Type of the Clock Instance. There are five Device Types.	
	■ Ord-Bound - clock's Device Type is Ordinary-Boundary Clock.	
	■ P2p Transp - clock's Device Type is Peer to Peer Transparent Clock.	
	■ E2e Transp - clock's Device Type is End to End Transparent Clock.	
	■ Master Only - clock's Device Type is Master Only.	
	■ Slave Only - clock's Device Type is Slave Only	
• Profile	Indicates the profile used by the clock.	
Port List	Set check mark for each port configured for this Clock Instance.	
2 Step Flag	Static member: defined by the system, true if two-step Sync events and	
	Pdelay_Resp events are used.	

Clock Identity	It shows unique clock identifier.	
One Way	If true, one-way measurements are used. This parameter applies only to a slave.	
	In one-way mode no delay measurements are performed, i.e. this is applicable	
	only if frequency synchronization is needed. The master always responds to	
	delay requests.	
• Protocol	Transport protocol used by the PTP protocol engine	
	ethernet PTP over Ethernet multicast	
	ip4multi PTP over IPv4 multicast	
	ip4uni PTP over IPv4 unicast	
	Note : IPv4 unicast protocol only works in Master only and Slave only clocks	
	See parameter Device Type	
	In a unicast Slave only clock you also need configure which master clocks	
	to request Announce and Sync messages from. See: Unicast Slave	
	configuration	
VLAN Tag Enable	Enables the VLAN tagging for the PTP frames.	
	Note: Packets are only tagged if the port is configured for VLAN tagging.	
	i.e:	
	Port Type! = Unaware and Port VLAN mode == None, and the port is member of	
	the VLAN.	
• VID	VLAN Identifier used for tagging the PTP frames.	
• PCP	Priority Code Point value used for PTP frames.	

Buttons

Add New PTP Clock : Click to create a new clock instance.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Local Clock Current Time

Object	Description
PTP Time	Shows the actual PTP time with nanosecond resolution.
Clock Adjustment	Shows the actual clock adjustment method. The method depends on the
Method	available hardware.
Synchronize to	Activate this button to synchronize the System Clock to PTP Time.
System Clock	
Ports Configuration	Click to edit the port data set for the ports assigned to this clock instance.

Clock Default Data Set

Object	Description	
Clock ID	An internal instance id (03)	
Device Type	Indicates the Type of the Clock Instance. There are five Device Types.	
	■ Ord-Bound - clock's Device Type is Ordinary-Boundary Clock.	
	■ P2p Transp - clock's Device Type is Peer to Peer Transparent Clock.	
	■ E2e Transp - clock's Device Type is End to End Transparent Clock.	
	■ Master Only - clock's Device Type is Master Only.	
	Slave Only - clock's Device Type is Slave Only	
• 2 Step Flag	Static member: defined by the system, true if two-step Sync events and	
	Pdelay_Resp events are used	
• Ports	The total number of physical ports in the node	
Clock Identity	It shows unique clock identifier	
• Dom	Clock domain [0127].	
Clock Quality	The clock quality is determined by the system, and holds 3 parts: Clock Class,	
	Clock Accuracy and OffsetScaledLog Variance as defined in IEEE1588.	
	The Clock Accuracy values are defined in IEEE1588 table 6 (Currently the clock	
	Accuracy is set to 'Unknown' as default).	
• Pri1	Clock priority 1 [0255] used by the BMC master select algorithm.	
• Pri2	Clock priority 2 [0255] used by the BMC master select algorithm.	
• Protocol	Transport protocol used by the PTP protocol engine	
	ethernet PTP over Ethernet multicast	
	ip4multi PTP over IPv4 multicast	
	ip4uni PTP over IPv4 unicast	
One-Way	If true, one way measurements are used. This parameter applies only to a slave.	
	In one-way mode no delay measurements are performed, i.e. this is applicable	
	only if frequency synchronization is needed. The master always responds to	
	delay requests.	
VLAN Tag Enable	Enables the VLAN tagging for the PTP frames.	
• VID	VLAN Identifier used for tagging the VLAN packets.	
• PCP	Priority Code Point value used for PTP frames.	

Clock current Data Set

Description
Steps Removed : It is the number of PTP clocks traversed from the grandmaster
to the local slave clock.
Time difference between the master clock and the local slave clock, measured in
ns.
The mean propagation time for the link between the master and the local slave

Clock Parent Data Set

Object	Description
Parent Port Identity	Clock identity for the parent clock, if the local clock is not a slave, the value is
	the clocks own id.
• Port	Port Id for the parent master port
• P Stat	Parents Stats (always false).
• Var	It is observed parent offset scaled log variance
Change Rate	Observed Parent Clock Phase Change Rate. i.e. the slave clocks rate offset
	compared to the master. (unit = ns per s).
Grand Master Identity	Clock identity for the grand master clock, if the local clock is not a slave, the
	value is the clocks own id.
Grand Master Clock	The clock quality announced by the grand master (See description of Clock
Quality	Default Data Set: Clock Quality)
• Pri1	Clock priority 1 announced by the grand master
• Pri2	Clock priority 2 announced by the grand master

Servo Parameters

Object	Description
• Display	If true then Offset From Master, MeanPathDelay and clockAdjustment are
	logged on the debug terminal
P-enable	If true the P part of the algorithm is included
• I-enable	If true the I part of the algorithm is included
• D-enable	If true the D part of the algorithm is included
'P' constant	[11000] see above
• 'l' constant	[11000] see above
'D' constant	[11000] see above

Unicast Slave Configuration

Object	Description		
• Duration	The number of seconds a master is requested to send Announce/Sync		
	messages. The request is repeated from the slave each Duration/4 seconds.		
• Ip-address	IPv4 Address of the Master clock		
• grant	The granted repetition period for the sync message		
Comm State	The state of the communication with the master, possible values are:		
	■ IDLE : The entry is not in use.		
	■ INIT : Announce is sent to the master (Waiting for a response).		
	■ CONN : The master has responded.		
	■ SELL : The assigned master is selected as current master.		
	SYNC : The master is sending Sync messages.

4.4 Quality of Service

4.4.1 General

Quality of Service (QoS) is an advanced traffic prioritization feature that allows you to establish control over network traffic.

QoS enables you to assign various grades of network service to different types of traffic, such as multi-media, video, protocol-specific, time critical, and file-backup traffic.

QoS reduces bandwidth limitations, delay, loss, and jitter. It also provides increased reliability for delivery of your data and allows you to prioritize certain applications across your network. You can define exactly how you want the switch to treat selected applications and types of traffic. You can use QoS on your system to:

- Control a wide variety of network traffic by:
- · Classifying traffic based on packet attributes.
- Assigning priorities to traffic (for example, to set higher priorities to time-critical or business-critical applications).
- · Applying security policy through traffic filtering.
- Provide predictable throughput for multimedia applications such as video conferencing or voice over IP by minimizing delay and jitter.
- Improve performance for specific types of traffic and preserve performance as the amount of traffic grows.
- Reduce the need to constantly add bandwidth to the network.
- Manage network congestion.

QoS Terminology

- Classifier—classifies the traffic on the network. Traffic classifications are determined by protocol, application, source, destination, and so on. You can create and modify classifications. The Switch then groups classified traffic in order to schedule them with the appropriate service level.
- **DiffServ Code Point (DSCP)** is the traffic prioritization bits within an IP header that are encoded by certain applications and/or devices to indicate the level of service required by the packet across a network.
- Service Level defines the priority that will be given to a set of classified traffic. You can create and modify service
 levels.
- **Policy**—comprises a set of "rules" that are applied to a network so that a network meets the needs of the business.

 That is, traffic can be prioritized across a network according to its importance to that particular business type.
- QoS Profile consists of multiple sets of rules (classifier plus service level combinations). The QoS profile is assigned
 to a port(s).
- Rules comprises a service level and a classifier to define how the Switch will treat certain types of traffic. Rules are associated with a QoS Profile (see above).

To implement QoS on your network, you need to carry out the following actions:

- 1. Define a service level to determine the priority that will be applied to traffic.
- 2. Apply a classifier to determine how the incoming traffic will be classified and thus treated by the Switch.
- 3. Create a QoS profile which associates a service level and a classifier.
- **4.** Apply a QoS profile to a port(s).

4.4.1.1 QoS Port Classification

This page allows you to configure the basic QoS Classification settings for all switch ports. The Port classification screen in Figure 4-4-1-1 appears.

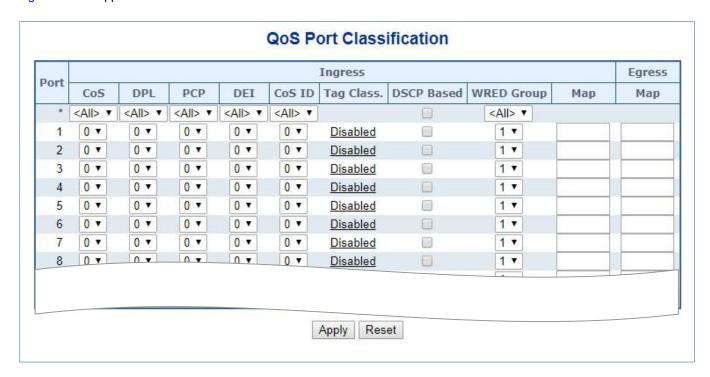

Figure 4-4-1-1: QoS Ingress Port Policers Page Screenshot

The page includes the following fields:

Object	Description
• Port	The port number for which the configuration below applies.
• CoS	Controls the default CoS value.
	All frames are classified to a CoS. There is a one to one mapping between CoS,
	queue and priority. A CoS of 0 (zero) has the lowest priority. If the port is VLAN
	aware, the frame is tagged and Tag Class. is enabled, then the frame is
	classified to a CoS that is mapped from the PCP and DEI value in the tag.
	Otherwise the frame is classified to the default CoS.
	The classified CoS can be overruled by a QCL entry.
	Note: If the default CoS has been dynamically changed, then the actual default
	CoS is shown in parentheses after the configured default CoS.
• DPL	Controls the default DPL value.
	All frames are classified to a Drop Precedence Level.
	If the port is VLAN aware, the frame is tagged and Tag Class. is enabled, then
	the frame is classified to a DPL that is mapped from the PCP and DEI value in
	the tag. Otherwise the frame is classified to the default DPL.
	The classified DPL can be overruled by a QCL entry.
• PCP	Controls the default PCP value.

	All frames are classified to a PCP value.			
	If the port is VLAN aware and the frame is tagged, then the frame is classified to			
	the PCP value in the tag. Otherwise the frame is classified to the default PCP			
	value.			
• DEI	Controls the default DEI value.			
	All frames are classified to a DEI value.			
	If the port is VLAN aware and the frame is tagged, then the frame is classified to			
	the DEI value in the tag. Otherwise the frame is classified to the default DEI			
	value.			
• CoS ID	Controls the default CoS ID value.			
	Every incoming frame is classified to a CoS ID, which later can be used as basis			
	for rewriting of different parts of the frame.			
Tag Class.	Shows the classification mode for tagged frames on this port.			
	Disabled: Use default CoS and DPL for tagged frames.			
	Enabled: Use mapped versions of PCP and DEI for tagged frames.			
	Click on the mode in order to configure the mode and/or mapping.			
	Note: This setting has no effect if the port is VLAN unaware. Tagged frames			
	received on VLAN unaware ports are always classified to the default CoS and			
	DPL.			
DSCP Based	Click to Enable DSCP Based QoS Ingress Port Classification.			
WRED Group	Controls the WRED group membership.			
- Ingress Mar	Controls the Ingress Map selection through the Map ID. The Ingress Map ID			
Ingress Map	ranges from 0 to 255. An empty field indicates no map selection.			
Egress Map	Controls the Egress Map selection through the Map ID. The Egress Map ID			
	ranges from 0 to 511. An empty field indicates no map selection

4.4.1.2 Queue Policing

This page allows you to configure the Queue Policer settings for all switch ports.. The Queue Policing screen in Figure 4-4-1-2 appears.

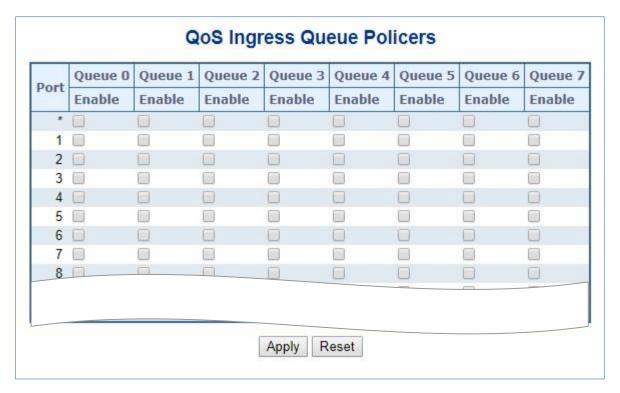

Figure 4-4-1-2: QoS Ingress Port Classification Page Screenshot

The page includes the following fields:

Object	Description
• Port	The port number for which the configuration below applies.
• Enable (E)	Enable or disable the queue policer for this switch port.
• Rate	Controls the rate for the queue policer. This value is restricted to 25- 13128147 when "Unit" is kbps, and 1-13128 when "Unit" is Mbps. The rate is internally rounded up to the nearest value supported by the queue policer. This field is only shown if at least one of the queue policers are enabled.
• Unit	Controls the unit of measure for the queue policer rate as kbps or Mbps. This field is only shown if at least one of the queue policers are enabled.

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.4.1.3 Port Tag Remarking

This page provides an overview of QoS Egress Port Tag Remarking for all switch ports. The Port tag remarking screen in Figure 4-4-1-3 appears.

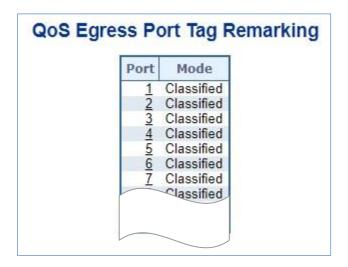

Figure 4-4-1-3: Port Tag Remarking Page Screenshot

The page includes the following fields:

Object	Description	
• Port	he logical port for the settings contained in the same row.	
	Click on the port number in order to configure tag remarking	
• Mode	Shows the tag remarking mode for this port.	
	Classified: Use classified PCP/DEI values.	
	Default: Use default PCP/DEI values.	
	Mapped: Use mapped versions of <u>CoS</u> and <u>DPL</u> .	

4.4.1.4 WRED

This page allows you to configure the Random Early Detection (RED) settings.. The Port Shaper screen in Figure 4-4-4 appears.

Group	Queue	DPL	Enable	Min	Max	Max Unit
1	0	1		0	0	Drop Probability •
1	0	2		0	0	Drop Probability •
1	0	3		46	112	Drop Probability ▼
1	1	1	•	226	197	Drop Probability ▼
1	1	2		0	0	Drop Probability ▼
1	1	3		0	0	Drop Probability ▼
1	2	1	•	0	0	Drop Probability ▼
1	2	2		0	0	Drop Probability ▼
1	2	3		145	255	Drop Probability ▼
1	3	1	•	223	197	Drop Probability ▼
4				0	0	Drop Probability ▼

Figure 4-4-1-4: QoS Egress Port Shapers Page Screenshot

The page includes the following fields:

Object	Description	
• Group	The WRED group number for which the configuration below applies.	
• Queue	The queue number (CoS) for which the configuration below applies.	
• DPL	The Drop Precedence Level for which the configuration below applies.	
• Enable	Controls whether RED is enabled for this entry.	
• Min	Controls the lower RED fill level threshold. If the queue filling level is below this	
	threshold, the drop probability is zero. This value is restricted to 0-100%.	
• Max	Controls the upper RED drop probability or fill level threshold for frames marked	
	with <u>Drop Precedence Level</u> > 0 (yellow frames). This value is restricted to 1-	
	100%.	
Max Unit	Selects the unit for Max. Possible values are:	
	Drop Probability: Max controls the drop probability just below 100% fill	
	level.	
	Fill Level: Max controls the fill level where drop probability reaches 100%

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.4.1.5 Statistics

This page provides statistics for the different queues for all switch ports. The statistice screen in Figure 4-4-1-5 appears.

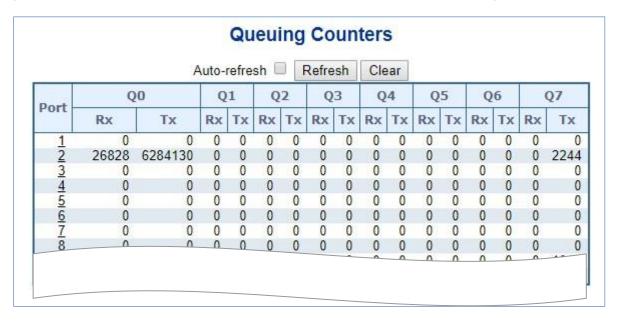

Figure 4-4-1-5: QoS statistics Page Screenshot

The page includes the following fields:

Object	Description
• Port	The logical port for the settings contained in the same row.
• Qn	There are 8 QoS queues per port. Q0 is the lowest priority queue.
• Rx/Tx	The number of received and transmitted packets per queue.

Buttons

Refresh: Click to refresh the page immediately.

Clear: Clears the counters for all ports

4.4.2 Bandwidth Control

4.4.2.1 Port Policing

This page allows you to configure the Policer settings for all switch ports. The Port Policing screen in Figure 4-4-2-1 appears.

QoS Ingress Port Policers				
Port	Enabled	Rate	Unit	Flow Control
*		500	<alb td="" 🕶<=""><td></td></alb>	
1		500	kbps 💌	
2		500	kbps 💌	
3		500	kbps 💌

5		500	kbps 💌	
6		500	kbps 💌	
7		500	kbps 💌	
			l-l-ma	

Figure 4-4-2-1: QoS Ingress Port Policers Page Screenshot

The page includes the following fields:

Object	Description
• Port	The port number for which the configuration below applies.
• Enable	Controls whether the policer is enabled on this switch port.
• Rate	Controls the rate for the policer. This value is restricted to 100-1000000 when the "Unit" is " kbps " or " fps ", and it is restricted to 1-3300 when the "Unit" is
	"Mbps" or "kfps". The default value is 500.
• Unit	Controls the unit of measure for the policer rate as kbps , Mbps , fps or kfps . The default value is " kbps ".
Flow Control	If flow control is enabled and the port is in flow control mode, then pause frames are sent instead of discarding frames.

Buttons

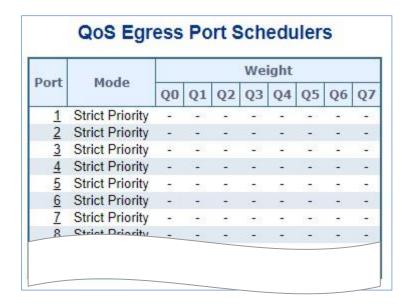

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.4.2.2 Port Schedule

The Port Scheduler and Shapers for a specific port are configured on this page. The QoS Egress Port Schedule and Shaper screen in Figure 4-4-2-2 appears.

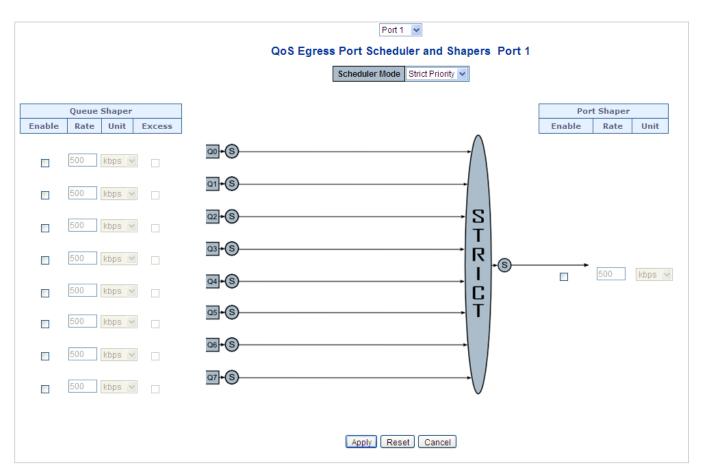

Figure 4-4-2-2: QoS Egress Port Schedule and Shapers Page Screenshot

The page includes the following fields:

Object	Description	
Schedule Mode	Controls whether the scheduler mode is "Strict Priority" or "Weighted" on this	
	switch port.	
Queue Shaper Enable	Controls whether the queue shaper is enabled for this queue on this switch port.	
Queue Shaper Rate	Controls the rate for the queue shaper.	
	This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is	
	restricted to 1-13200 when the "Unit" is "Mbps".	
	The default value is 500 .	
Queue Shaper Unit	Controls the unit of measure for the queue shaper rate as "kbps" or "Mbps".	
	The default value is "kbps".	
Queue Shaper Excess	Controls whether the queue is allowed to use excess bandwidth.	
Queue Scheduler	Controls the weight for this queue.	
Weight	This value is restricted to 1-100. This parameter is only shown if "Scheduler	
	Mode" is set to "Weighted".	
	The default value is "17".	
Queue Scheduler	Shows the weight in percent for this queue. This parameter is only shown if	
Percent	"Scheduler Mode" is set to "Weighted".	
Port Shaper Enable	Controls whether the port shaper is enabled for this switch port.	
Port Shaper Rate	Controls the rate for the port shaper.	
	This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is	
	restricted to 1-13200 when the "Unit" is "Mbps".	
	The default value is 500.	
Port Shaper Unit	Controls the unit of measure for the port shaper rate as "kbps" or "Mbps".	
	The default value is "kbps".	

Buttons

Apply: Click to apply changes

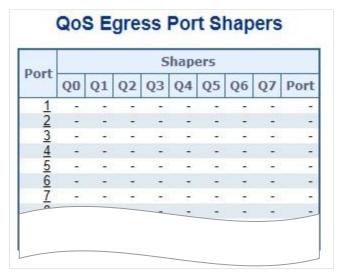

Reset : Click to undo any changes made locally and revert to previously saved values.

Cancel: Click to undo any changes made locally and return to the previous page.

4.4.2.3 Port Shaping

This page provides an overview of QoS Egress Port Shapers for all switch ports. The Port shaping screen in Figure 4-4-2-3 appears.

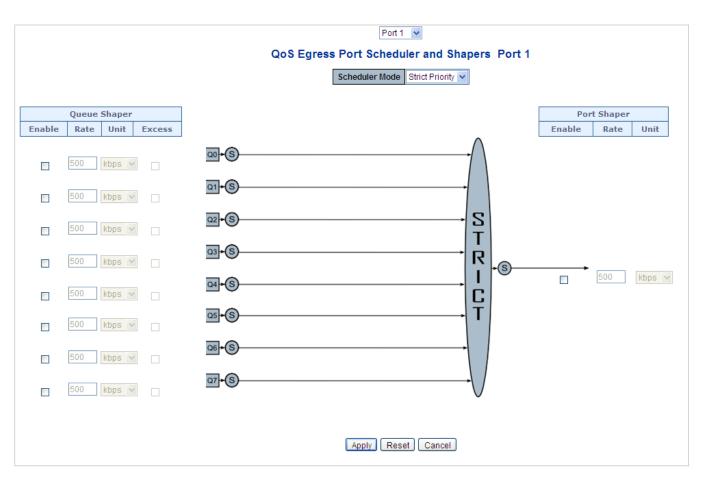

Figure 4-4-2-3: QoS Egress Port Schedule and Shapers Page Screenshot

The page includes the following fields:

Object	Description
Schedule Mode	Controls whether the scheduler mode is "Strict Priority" or "Weighted" on this
	switch port.
Queue Shaper Enable	Controls whether the queue shaper is enabled for this queue on this switch port.
Queue Shaper Rate	Controls the rate for the queue shaper.
	This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is
	restricted to 1-13200 when the "Unit" is "Mbps".
	The default value is 500 .
Queue Shaper Unit	Controls the unit of measure for the queue shaper rate as "kbps" or "Mbps".
	The default value is "kbps".
Queue Shaper Excess	Controls whether the queue is allowed to use excess bandwidth.
Queue Scheduler	Controls the weight for this queue.
Weight	This value is restricted to 1-100. This parameter is only shown if "Scheduler
	Mode" is set to "Weighted".
	The default value is "17".
Queue Scheduler	Shows the weight in percent for this queue. This parameter is only shown if
Percent	"Scheduler Mode" is set to "Weighted".
Port Shaper Enable	Controls whether the port shaper is enabled for this switch port.
Port Shaper Rate	Controls the rate for the port shaper.
	This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is
	restricted to 1-13200 when the "Unit" is "Mbps".
	The default value is 500.
Port Shaper Unit	Controls the unit of measure for the port shaper rate as "kbps" or "Mbps".
	The default value is "kbps".

Reset: Click to undo any changes made locally and revert to previously saved values.

<u>Cancel</u>: Click to undo any changes made locally and return to the previous page.

4.4.3 Storm Control

4.4.3.1 Storm Policing Configuration

Storm control for the switch is configured on this page. There is a unicast storm rate control, multicast storm rate control, and a broadcast storm rate control. These only affect flooded frames, i.e. frames with a (VLAN ID, DMAC) pair not present on the MAC Address table.

The configuration indicates the permitted packet rate for unicast, multicast or broadcast traffic across the switch.

The Storm Control Configuration screen in Figure 4-4-3-1 appears.

Dowt	Uı	nicast Fram	ies	Bro	adcast Fra	mes	Unknown Frames			
Port	Enabled	Rate	Unit	Enabled	Rate	Unit	Unit Enabled		Unit	
*		500	<all></all>		500	<all></all>		500	<all> 🕶</all>

Apply: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.4 Differentiated Service

4.4.4.1 Port DSCP

This page allows you to configure the basic QoS Port DSCP Configuration settings for all switch ports. The Port DSCP screen in Figure 4-4-4-1 appears.

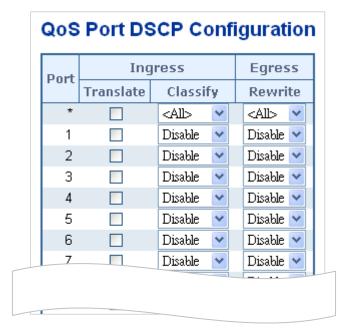

Figure 4-4-4-1: QoS Port DSCP Configuration Page Screenshot

Object	Description
• Port	The Port column shows the list of ports for which you can configure dscp ingress
	and egress settings.
• Ingress	In Ingress settings you can change ingress translation and classification settings
	for individual ports.
	There are two configuration parameters available in Ingress:
	■ Translate
	■ Classify
• Translate	To Enable the Ingress Translation click the checkbox.
• Classify	Classification for a port have 4 different values.
	■ Disable : No Ingress DSCP Classification.
	■ DSCP=0 : Classify if incoming (or translated if enabled) DSCP is 0.
	■ Selected: Classify only selected DSCP for which classification is enabled
	as specified in DSCP Translation window for the specific DSCP.
	■ All: Classify all DSCP.
• Egress	Port Egress Rewriting can be one of -
	■ Disable : No Egress rewrite.
	■ Enable: Rewrite enable without remapped.
	■ Remap DP Unaware: DSCP from analyzer is remapped and frame is

remarked with remapped DSCP value. The remapped DSCP value is always taken from the 'DSCP Translation->Egress Remap DP0' table.

Remap DP Aware: DSCP from analyzer is remapped and frame is

remarked with remapped DSCP value. Depending on the DP level of the frame, the remapped DSCP value is either taken from the 'DSCP Translation->Egress Remap DP0' table or from the 'DSCP Translation->Egress Remap DP1' table.

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.4.4.2 DSCP-based QoS

This page allows you to configure the basic QoS DSCP-based QoS Ingress Classification settings for all switches. The DSCP-based QoS screen in Figure 4-4-4-2 appears.

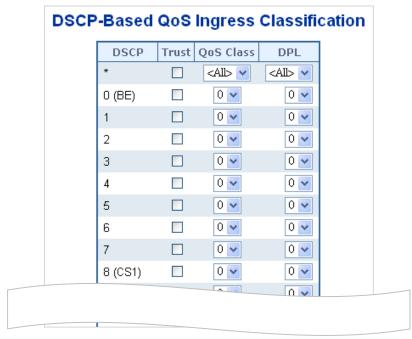

Figure 4-4-4: DSCP-based QoS Ingress Classification Page Screenshot

Object	Description
• DSCP	Maximum number of supported DSCP values are 64.
• Trust	Controls whether a specific DSCP value is trusted. Only frames with trusted
	DSCP values are mapped to a specific QoS class and Drop Precedence Level.
	Frames with untrusted DSCP values are treated as a non-IP frame.
QoS Class	QoS Class value can be any of (0-7)
• DPL	Drop Precedence Level (0-1)

4.4.4.3 DSCP Translation

This page allows you to configure the basic QoS DSCP Translation settings for all switches. DSCP translation can be done in Ingress or Egress. The DSCP Translation screen in Figure 4-4-4-3 appears.

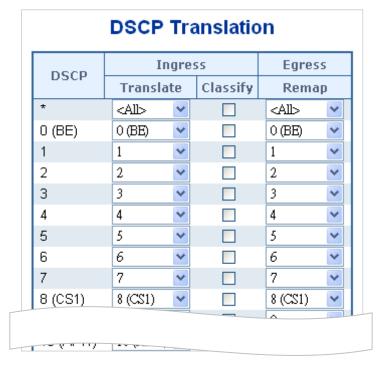

Figure 4-4-4-3: DSCP Translation Page Screenshot

The page includes the following fields:

Object	Description				
• DSCP	Maximum number of supported DSCP values are 64 and valid DSCP value				
	ranges from 0 to 63.				
• Ingress	Ingress side DSCP can be first translated to new DSCP before using the DSCP				
	for QoS class and DPL map.				
	There are two configuration parameters for DSCP Translation –				
	Translate				
	Classify				
Translate	DSCP at Ingress side can be translated to any of (0-63) DSCP values.				
• Classify	Click to enable Classification at Ingress side.				
• Egress	There is following configurable parameter for Egress side -				
	Remap				
Remap DP	Select the DSCP value from select menu to which you want to remap. DSCP				
	value ranges form 0 to 63.				

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.4.4.4 DSCP Classification

This page allows you to map DSCP value to a QoS Class and DPL value. The DSCP Classification screen in Figure 4-4-4-4 appears.

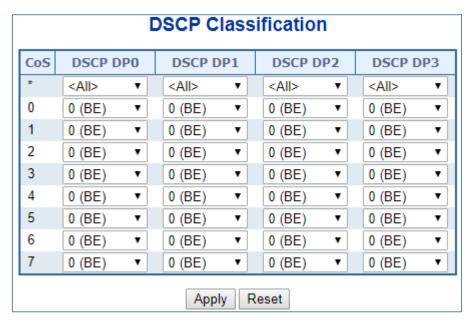

Figure 4-4-4: DSCP Classification Page Screenshot

The page includes the following fields:

Object	Description
• QoS Class	Available QoS Class value ranges from 0 to 7. QoS Class (0-7) can be mapped
	to followed parameters.
• DPL	Actual Drop Precedence Level.
• DSCP	Select DSCP value (0-63) from DSCP menu to map DSCP to corresponding
	QoS Class and DPL value

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.4.5 QCL

4.4.5.1 QoS Control List

This page shows the QoS Control List(QCL), which is made up of the QCEs. Each row describes a QCE that is defined. The maximum number of QCEs is 256 on each switch.

Click on the lowest plus sign to add a new QCE to the list. The QoS Control List screen in Figure 4-4-5-1 appears.

	QoS Control List Configuration																
Q	CE	Port	DMAC	SMAC	Tag Type	VID	PCP	DEI	Frame Type	CoS	DPL	DSCP		ction DEI		Ingress Map	
	lacktriangle																

Figure 4-4-5-1: QoS Control List Configuration Page Screenshot

Object	Description				
• QCE#	Indicates the index of QCE.				
• Port	Indicates the list of ports configured with the QCE.				
• DMAC	Specify the type of Destination MAC addresses for incoming frame. Possible				
	values are:				
	Any: All types of Destination MAC addresses are allowed.				
	■ Unicast: Only Unicast MAC addresses are allowed.				
	Multicast: Only Multicast MAC addresses are allowed.				
	■ Broadcast: Only Broadcast MAC addresses are allowed.				
	The default value is 'Any'.				
• SMAC	Displays the OUI field of Source MAC address, i.e. first three octet (byte) of				
	MAC address.				
• Tag Type	Indicates tag type. Possible values are:				
	■ Any: Match tagged and untagged frames.				
	■ Untagged: Match untagged frames.				
	■ Tagged: Match tagged frames.				
	The default value is 'Any'				
• VID	Indicates (VLAN ID), either a specific VID or range of VIDs. VID can be in the				
	range 1-4095 or 'Any'				
• PCP	Priority Code Point: Valid value PCP are specific(0, 1, 2, 3, 4, 5, 6, 7) or range(0-				
	1, 2-3, 4-5, 6-7, 0-3, 4-7) or 'Any'.				
• DEI	Drop Eligible Indicator: Valid value of DEI can be any of values between 0, 1 or				
	'Any'.				

Frame Type	Indicates the type of frame to look for incoming frames. Possible frame types					
	are:					
	■ Any: The QCE will match all frame type.					
	■ Ethernet: Only Ethernet frames (with Ether Type 0x600-0xFFFF)					
	are allowed.					
	■ LLC: Only (LLC) frames are allowed.					
	SNAP: Only (SNAP) frames are allowed.					
	■ IPv4: The QCE will match only IPV4 frames.					
	■ IPv6: The QCE will match only IPV6 frames.					
• Action	Indicates the classification action taken on ingress frame if parameters					
	configured are matched with the frame's content.					
	There are seven action fields:					
	Class: Classified QoS class.					
	■ DPL: Classified Drop Precedence Level.					
	■ DSCP: Classified DSCP value.					
	■ PCP: Classify PCP value.					
	■ DEI : Classify DEI value.					
	■ Policy: Classify ACL Policy number.					
	Ingress Map: Classify Ingress Map ID.					
• Modification Buttons	You can modify each QCE in the table using the following buttons:					
	(b): Inserts a new QCE before the current row.					
	e: Edits the QCE.					
	①: Moves the QCE up the list.					
	Moves the QCE down the list.					
	😸: Deletes the QCE.					
	🕀: The lowest plus sign adds a new entry at the bottom of the list of QCL.					

4.4.5.2 QoS Control Entry Configuration

The QCE Configuration screen in Figure 4-4-5-2 appears.

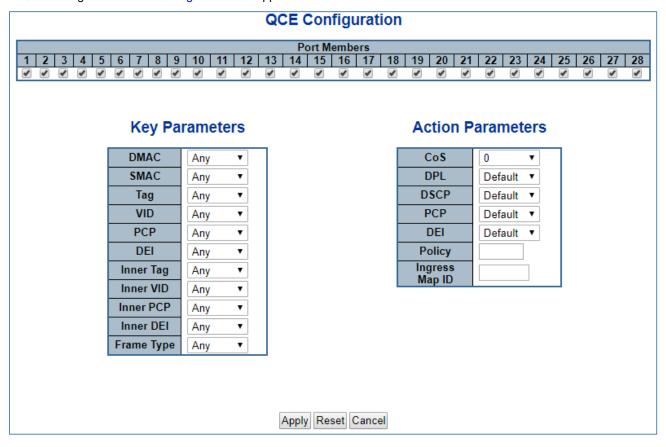

Figure 4-4-5-2: QCE Configuration Page Screenshot

Object	Description					
• Port Members	Check the checkbox button in case you what to make any port member of the					
	QCL entry. By default all ports will be checked					
Key Parameters	Key configuration are described as below:					
	■ DMAC Type Destination MAC type: possible values are unicast(UC),					
	multicast(MC), broadcast(BC) or 'Any'					
	■ SMAC Source MAC address: 24 MS bits (OUI) or 'Any'					
	■ Tag Value of Tag field can be 'Any', 'Untag' or 'Tag'					
	■ VID Valid value of VLAN ID can be any value in the range 1-4095 or 'Any';					
	user can enter either a specific value or a range of VIDs					
	PCP Priority Code Point: Valid value PCP are specific(0, 1, 2, 3, 4, 5, 6, 7)					
	or range(0-1, 2-3, 4-5, 6-7, 0-3, 4-7) or 'Any'					
	■ DEI Drop Eligible Indicator: Valid value of DEI can be any of values					
	between 0, 1 or 'Any'					
	■ Frame Type Frame Type can have any of the following values					

	1. Any					
	2. Ethernet					
	3. LLC					
	4. SNAP					
	5. IPv4					
	6. IPv6					
	Note: all frame types are explained below.					
• Any	Allow all types of frames.					
• EtherType	Ethernet Type Valid Ethernet type can have value within 0x600-0xFFFF or 'Any'					
	but excluding 0x800(IPv4) and 0x86DD(IPv6), default value is 'Any'.					
• LLC	SSAP Address Valid SSAP(Source Service Access Point) can vary from					
	0x00 to 0xFF or 'Any', the default value is 'Any'					
	■ DSAP Address Valid DSAP(Destination Service Access Point) can vary					
	from 0x00 to 0xFF or 'Any', the default value is 'Any'					
	Control Address Valid Control Address can vary from 0x00 to 0xFF or					
	'Any', the default value is 'Any'					
• SNAP	PID Valid PID(a.k.a Ethernet type) can have value within 0x00-0xFFFF or 'Any',					
	default value is 'Any'					
• IPv4	Protocol IP protocol number: (0-255, TCP or UDP) or 'Any'					
	Source IP Specific Source IP address in value/mask format or 'Any'. IP					
	and Mask are in the format x.y.z.w where x, y, z, and w are decimal					
	numbers between 0 and 255. When Mask is converted to a 32-bit binary					
	string and read from left to right, all bits following the first zero must also					
	be zero					
	DSCP Diffserv Code Point value(DSCP): It can be specific value, range of					
	value or 'Any'. DSCP values are in the range 0-63 including BE, CS1-CS7,					
	EF or AF11-AF43					
	■ IP Fragment IPv4 frame fragmented option: yes no any					
	Sport Source TCP/UDP port:(0-65535) or 'Any', specific or port range					
	applicable for IP protocol UDP/TCP					
	■ Dport Destination TCP/UDP port:(0-65535) or 'Any', specific or port range					
	applicable for IP protocol UDP/TCP					
• IPv6	Protocol IP protocol number: (0-255, TCP or UDP) or 'Any'					
	Source IP IPv6 source address: (a.b.c.d) or 'Any', 32 LS bits					
	DSCP Diffserv Code Point value(DSCP): It can be specific value, range of value					
	or 'Any'. DSCP values are in the range 0-63 including BE, CS1-CS7, EF or					
	AF11-AF43					
	Sport Source TCP/UDP port:(0-65535) or 'Any', specific or port range applicable					
	for IP protocol UDP/TCP					
	Dport Destination TCP/UDP port:(0-65535) or 'Any', specific or port range					

	applicable for IP protocol UDP/TCP
Action Parameters	Class QoS class: (0-7) or 'Default'.
	DPL Valid Drop Precedence Level can be (0-3) or 'Default'.
	DSCP Valid DSCP value can be (0-63, BE, CS1-CS7, EF or AF11-AF43) or
	'Default'.
	'Default' means that the default classified value is not modified by this QCE.

Buttons

4.4.5.3 QCL Status

This page shows the QCL status by different QCL users. Each row describes the QCE that is defined. It is a conflict if a specific QCE is not applied to the hardware due to hardware limitations. The maximum number of QCEs is **256** on each switch. The QoS Control List Status screen in Figure 4-4-5-3 appears.

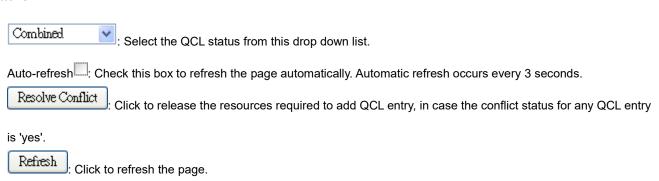

Figure 4-4-5-3: QoS Control List Status Page Screenshot

Object	Description
• User	Indicates the QCL user.
• QCE#	Indicates the index of QCE.
• Port	Indicates the list of ports configured with the QCE.
• Frame Type	Indicates the type of frame to look for incoming frames. Possible frame types

	are:
	Any: The QCE will match all frame types.
	■ Ethernet: Only Ethernet frames (with Ether Type 0x600-0xFFFF)
	are allowed.
	■ LLC: Only (LLC) frames are allowed.
	SNAP : Only (SNAP) frames are allowed.
	■ IPv4: The QCE will match only IPV4 frames.
	■ IPv6: The QCE will match only IPV6 frames.
• Action	Indicates the classification action taken on ingress frame if parameters
	configured are matched with the frame's content.
	There are three action fields: Class, DPL and DSCP.
	■ Class: Classified QoS class; if a frame matches the QCE it will be
	put in the queue.
	■ DPL : Drop Precedence Level; if a frame matches the QCE then DP
	level will set to value displayed under DPL column.
	DSCP : If a frame matches the QCE then DSCP will be classified
	with the value displayed under DSCP column.
• Conflict	Displays Conflict status of QCL entries. As H/W resources are shared by
	multiple applications. It may happen that resources required to add a QCE may
	not be available, in that case it shows conflict status as 'Yes', otherwise it is
	always 'No'.
	Please note that conflict can be resolved by releasing the H/W resources
	required to add QCL entry on pressing 'Resolve Conflict' button.

Buttons

4.4.6 Voice VLAN

The Voice VLAN feature enables voice traffic forwarding on the Voice VLAN, then the switch can classify and schedule network traffic. It is recommended that there be two VLANs on a port - one for voice, one for data.

4.4.6.1 Voice VLAN Configuration

Before connecting the IP device to the switch, the IP phone should configure the voice VLAN ID correctly. It should be configured through its own GUI. The Voice VLAN Configuration screen in Figure 4-4-6-1 appears.

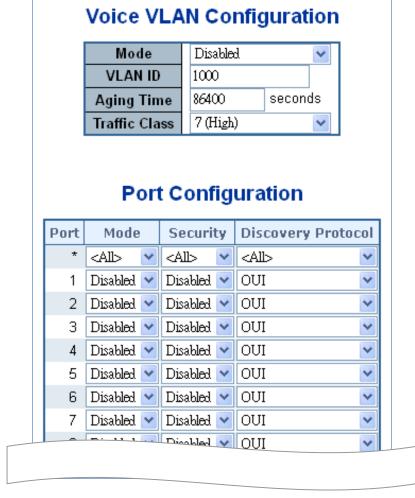

Figure 4-4-6-1: Voice VLAN Configuration Page Screenshot

Object	Description
• Mode	Indicates the Voice VLAN mode operation. We must disable MSTP feature
	before we enable Voice VLAN. It can avoid the conflict of ingress filter. Possible
	modes are:
	■ Enabled: Enable Voice VLAN mode operation.
	■ Disabled : Disable Voice VLAN mode operation.
VLAN ID	Indicates the Voice VLAN ID. It should be a unique VLAN ID in the system and

	cannot equal each port PVID. It is conflict configuration if the value equal
	management VID, MVR VID, PVID etc.
	The ellipsed represent to 4 to 4005
	The allowed range is 1 to 4095.
Aging Time	Indicates the Voice VLAN secure learning age time. The allowed range is 10 to
	10000000 seconds. It used when security mode or auto detect mode is enabled.
	In other cases, it will based hardware age time.
	The actual age time will be situated in the [age_time; 2 * age_time] interval.
Traffic Class	Indicates the Voice VLAN traffic class. All traffic on Voice VLAN will apply this
	class.
• Mode	Indicates the Voice VLAN port mode.
	Possible port modes are:
	Disabled : Disjoin from Voice VLAN.
	Auto: Enable auto detect mode. It detects whether there is VoIP
	phone attached to the specific port and configures the Voice VLAN
	members automatically.
	Forced: Force join to Voice VLAN.
Port Security	Indicates the Voice VLAN port security mode. When the function is enabled, all
	non-telephone MAC address in Voice VLAN will be blocked 10 seconds.
	Possible port modes are:
	■ Enabled: Enable Voice VLAN security mode operation.
	■ Disabled : Disable Voice VLAN security mode operation.
Port Discovery	Indicates the Voice VLAN port discovery protocol. It will only work when auto
Protocol	detect mode is enabled. We should enable LLDP feature before configuring
	discovery protocol to "LLDP" or "Both". Changing the discovery protocol to "OUI"
	or "LLDP" will restart auto detect process. Possible discovery protocols are:
	OUI: Detect telephony device by OUI address.
	■ LLDP: Detect telephony device by LLDP.
	Both: Both OUI and LLDP.

4.4.6.2 Voice VLAN OUI Table

Configure VOICE VLAN OUI table on this page. The maximum entry number is 16. Modifying the OUI table will restart auto detection of OUI process. The Voice VLAN OUI Table screen in Figure 4-4-6-2 appears.

Figure 4-4-6-2: Voice VLAN OUI Table Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
Telephony OUI	An telephony OUI address is a globally unique identifier assigned to a vendor by
	IEEE. It must be 6 characters long and the input format is "xx-xx-xx" (x is a
	hexadecimal digit).
• Description	The description of OUI address. Normally, it describes which vendor telephony
	device it belongs to.
	The allowed string length is 0 to 32.

Buttons

Add New Entry
: Click to add a new access management entry.

Apply
: Click to apply changes

Reset
: Click to undo any changes made locally and revert to previously saved values.

4.5 Security

4.5.1 Access Security

4.5.1.1 Access Management

Configure access management table on this page. The maximum entry number is 16. If the application's type match any one of the access management entries, it will allow access to the switch. The Access Management Configuration screen in Figure 4-5-1-1 appears.

Figure 4-5-1-1: Access Management Configuration Overview Page Screenshot

The page includes the following fields:

Object	Description
• Mode	Indicates the access management mode operation. Possible modes are:
	Enabled: Enable access management mode operation.
	Disabled: Disable access management mode operation.
• Delete	Check to delete the entry. It will be deleted during the next apply .
VLAN ID	Indicates the VLAN ID for the access management entry.
Start IP address	Indicates the start IP address for the access management entry.
End IP address	Indicates the end IP address for the access management entry.
HTTP/HTTPS	Indicates the host can access the switch from HTTP/HTTPS interface that the
	host IP address matched the entry.
• SNMP	Indicates the host can access the switch from SNMP interface that the host IP
	address matched the entry.
Telnet/SSH	Indicates the host can access the switch from TELNET/SSH interface that the
	host IP address matched the entry.

Buttons

Add New Entry : Click to add a new access management entry.

Apply : Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.1.2 Access Management Statistics

This page provides statistics for access management. The Access Management Statistics screen in Figure 4-5-1-2 appears.

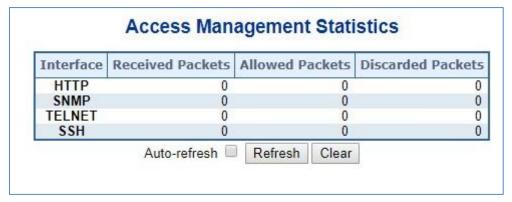

Figure 4-5-1-2: Access Management Statistics Overview Page Screenshot

The page includes the following fields:

Object	Description
• Interface	The interface that allowed remote host can access the switch.
Receive Packets	The received packets number from the interface under access management
	mode is enabled.
Allow Packets	The allowed packets number from the interface under access management
	mode is enabled.
Discard Packets	The discarded packets number from the interface under access management
	mode is enabled.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

Clear : Clears all statistics.

4.5.1.3 SSH

Configure SSH on this page. This page shows the Port Security status. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise.

The status page is divided into two sections - one with a legend of user modules and one with the actual port status. The SSH Configuration screen in Figure 4-5-1-3 appears.

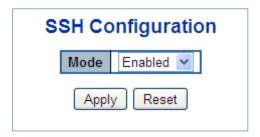

Figure 4-5-1-3: SSH Configuration Screen Page Screenshot

The page includes the following fields:

Object	Description
• Mode	Indicates the SSH mode operation. Possible modes are:
	■ Enabled: Enable SSH mode operation.
	■ Disabled : Disable SSH mode operation.
	■ Disabled : Disable SSH mode operation.

Buttons

Apply : Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.1.4 HTTPs

Configure HTTPS on this page. The HTTPS Configuration screen in Figure 4-5-1-4 appears.

Figure 4-5-1-4: HTTPS Configuration Screen Page Screenshot

Object	Description
-	
• Mode	Indicates the HTTPS mode operation. When the current connection is HTTPS,
	to apply HTTPS disabled mode operation will automatically redirect web browser
	to an HTTP connection. Possible modes are:
	■ Enabled: Enable HTTPS mode operation.
	■ Disabled : Disable HTTPS mode operation.
Automatic Redirect	Indicates the HTTPS redirect mode operation. It only significant if HTTPS mode
	"Enabled" is selected. Automatically redirects web browser to an HTTPS
	connection when both HTTPS mode and Automatic Redirect are enabled or
	redirects web browser to an HTTP connection when both are disabled. Possible
	modes are:
	■ Enabled: Enable HTTPS redirect mode operation.
	■ Disabled : Disable HTTPS redirect mode operation.
Certificate Maintain	The operation of certificate maintenance.
	Possible operations are:
	None: No operation.
	Delete: Delete the current certificate.
	Upload: Upload a certificate PEM file. Possible methods are: web
	Browser Of URL.
	Generate: Generate a new self-signed RSA certificate.
Certificate Pass	Enter the pass phrase in this field if your uploading certificate is protected by a
Phrase	specific passphrase.

• Certificate Upload

Upload a certificate PEM file into the switch. The file should contain the certificate and private key together. If you have two separated files for saving certificate and private key. Use the Linux cat command to combine them into a single PEM file. For example, cat my.cert my.key > my.pem

Notice that the RSA certificate is recommended since most of the new version of browsers has removed support for DSA in certificate, e.g. Firefox v37 and Chrome v39.

Possible methods are:

Web Browser: Upload a certificate via Web browser.

URL: Upload a certificate via URL, the supported protocols are <u>HTTP</u>, <u>HTTPS</u>, <u>TFTP</u> and <u>FTP</u>. The URL format is

cprotocol>://[<username>[:<password>]@]

host>[:<port>][/<path>]/<file_name>. For example,

tftp://10.10.10.10/new_image_path/new_image.dat,

http://username:password@10.10.10.10:80/new_image_path/new_image.dat. A valid file name is a text string drawn from alphabet (A-Za-z), digits (0-9), dot (.), hyphen (-), under score(_). The maximum length is 63 and hyphen must not be first character. The file name content that only contains '.' is not allowed.

• Certificate Status

Display the current status of certificate on the switch.

Possible statuses are:

Switch secure HTTP certificate is presented.

Switch secure HTTP certificate is not presented.

Switch secure HTTP certificate is generating ...

Buttons

Save : Click to save changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

Refresh : Click to refresh the page. Any changes made locally will be undone.

4.5.2 AAA

This section is to control the access to the **Industrial Managed Switch**, including the user access and management control. The Authentication section contains links to the following main topics:

- User Authentication
- IEEE 802.1X Port-based Network Access Control
- MAC-based Authentication

Overview of 802.1X (Port-Based) Authentication

In the 802.1X-world, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The switch acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as **EAPOL (EAP Over LANs)** frames. EAPOL frames encapsulate **EAP PDUs** (RFC3748). Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible, in that it allows for different authentication methods, like **MD5-Challenge**, **PEAP**, and **TLS**. The important thing is that the authenticator (the switch) doesn't need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it.

When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication.

Besides forwarding this decision to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant.

Overview of MAC-based Authentication

Unlike 802.1X, MAC-based authentication is not a standard, but merely a best-practices method adopted by the industry. In MAC-based authentication, users are called clients, and the switch acts as the supplicant on behalf of clients. The initial frame (any kind of frame) sent by a client is snooped by the switch, which in turn uses the client's MAC address as both username and password in the subsequent EAP exchange with the RADIUS server. The 6-byte MAC address is converted to a string on the following form "xx-xx-xx-xx-xx-xx", that is, a dash (-) is used as separator between the lower-cased hexadecimal digits. The switch only supports the MD5-Challenge authentication method, so the RADIUS server must be configured accordingly.

When authentication is complete, the RADIUS server sends a success or failure indication, which in turn causes the switch to open up or block traffic for that particular client, using static entries into the MAC Table. Only then will frames from the client be forwarded on the switch. There are no EAPOL frames involved in this authentication, and therefore, MAC-based Authentication has nothing to do with the 802.1X standard.

The advantage of MAC-based authentication over 802.1X is that several clients can be connected to the same port (e.g. through a 3rd party switch or a hub) and still require individual authentication, and that the clients don't need special supplicant software to authenticate. The disadvantage is that MAC addresses can be spoofed by malicious users, equipment whose MAC address is a valid RADIUS user can be used by anyone, and only the MD5-Challenge method is supported.

The 802.1X and MAC-Based Authentication configuration consists of two sections, a system- and a port-wide.

Overview of User Authentication

It is allowed to configure the **Industrial Managed Switch** to authenticate users logging into the system for management access using local or remote authentication methods, such as telnet and Web browser. This **Industrial Managed Switch** provides secure network management access using the following options:

- Remote Authentication Dial-in User Service (RADIUS)
- Terminal Access Controller Access Control System Plus (TACACS+)
- Local user name and Privilege Level control

RADIUS and TACACS+ are logon authentication protocols that use software running on a central server to control access to RADIUS-aware or TACACS-aware devices on the network. An **authentication server** contains a database of multiple user name / password pairs with associated privilege levels for each user that requires management access to the **Industrial**Managed Switch.

Understanding IEEE 802.1X Port-based Authentication

The IEEE 802.1X standard defines a client-server-based access control and authentication protocol that restricts unauthorized clients from connecting to a LAN through publicly accessible ports. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Until the client is authenticated, 802.1X access control allows only **Extensible Authentication Protocol over LAN (EAPOL)** traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

This section includes this conceptual information:

- Device Roles
- Authentication Initiation and Message Exchange
- · Ports in Authorized and Unauthorized States

Device Roles

With 802.1X port-based authentication, the devices in the network have specific roles as shown below.

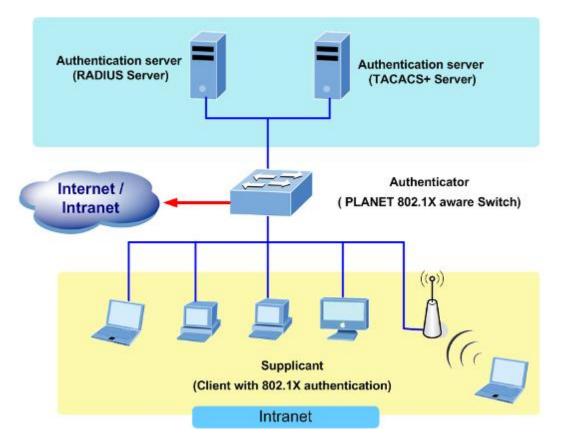

Figure 4-5-2-1

- Client—the device (workstation) that requests access to the LAN and switch services and responds to requests from
 the switch. The workstation must be running 802.1X-compliant client software such as that offered in the Microsoft
 Windows XP operating system. (The client is the supplicant in the IEEE 802.1X specification.)
- Authentication server—performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch whether or not the client is authorized to access the LAN and switch services. Because the switch acts as the proxy, the authentication service is transparent to the client. In this release, the Remote Authentication Dial-In User Service (RADIUS) security system with Extensible Authentication Protocol (EAP) extensions is the only supported authentication server; it is available in Cisco Secure Access Control Server version 3.0. RADIUS operates in a client/server model in which secure authentication information is exchanged between the RADIUS server and one or more RADIUS clients.

• Switch (802.1X device)—controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client. The switch includes the RADIUS client, which is responsible for encapsulating and decapsulating the Extensible Authentication Protocol (EAP) frames and interacting with the authentication server. When the switch receives EAPOL frames and relays them to the authentication server, the Ethernet header is stripped and the remaining EAP frame is reencapsulated in the RADIUS format. The EAP frames are not modified or examined during encapsulation, and the authentication server must support EAP within the native frame format. When the switch receives frames from the authentication server, the server's frame header is removed, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

■ Authentication Initiation and Message Exchange

The switch or the client can initiate authentication. If you enable authentication on a port by using the **dot1x port-control auto** interface configuration command, the switch must initiate authentication when it determines that the port link state transitions from down to up. It then sends an EAP-request/identity frame to the client to request its identity (typically, the switch sends an initial identity/request frame followed by one or more requests for authentication information). Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client's identity

If 802.1X is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client transmits frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized.

The specific exchange of EAP frames depends on the authentication method being used. "Figure 4-5-2" shows a message exchange initiated by the client using the One-Time-Password (OTP) authentication method with a RADIUS server.

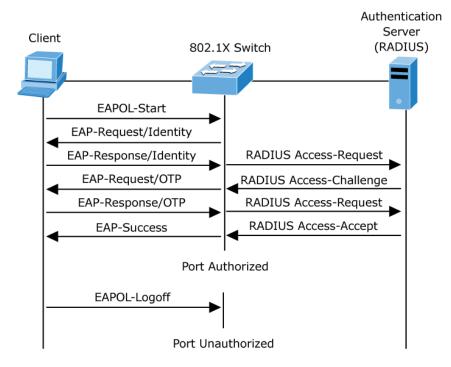

Figure 4-5-2-2: EAP Message Exchange

■ Ports in Authorized and Unauthorized States

The switch port state determines whether or not the client is granted access to the network. The port starts in the *unauthorized* state. While in this state, the port disallows all ingress and egress traffic except for 802.1X protocol packets. When a client is successfully authenticated, the port transitions to the *authorized* state, allowing all traffic for the client to flow normally.

If a client that does not support 802.1X is connected to an unauthorized 802.1X port, the switch requests the client's identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1X-enabled client connects to a port that is not running the 802.1X protocol, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can retransmit the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to transition to the unauthorized state.

If the link state of a port transitions from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

4.5.2.1 Authentication Configuration

This page allows you to configure how a user is authenticated when he logs into the switch via one of the management client interfaces. The Authentication Method Configuration screen in Figure 4-5-2-3 appears.

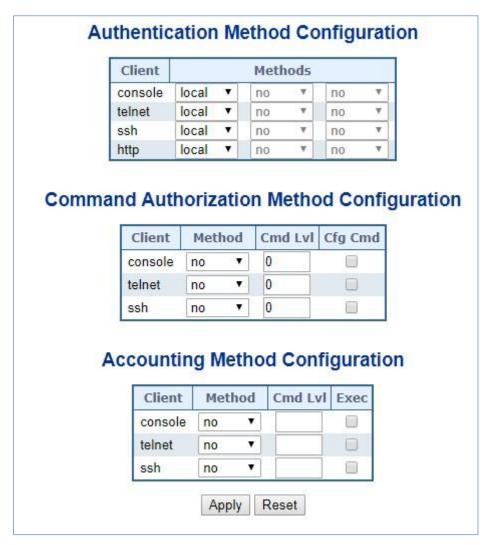

Figure 4-5-2-3: Authentication Method Configuration Page Screenshot

The page includes the following fields:

Authentication Method Configuration

The authentication section allows you to configure how a user is authenticated when he logs into theswitch via one of the management client interfaces.

The table has one row for each client type and a number of columns, which are:

Object	Description
• Client	The management client for which the configuration below applies.
• Methods	Method can be set to one of the following values:
	no: Authentication is disabled and login is not possible.
	local: Use the local user database on the switch for authentication.
	radius: Use remote <u>RADIUS</u> server(s) for authentication.
	tacacs: Use remote <u>TACACS+</u> server(s) for authentication

Command Authorization Method Configuration

The command authorization section allows you to limit the CLI commands available to a user.

The table has one row for each client type and a number of columns, which are:

Object	Description
• Client	The management client for which the configuration below applies.
• Methods	Method can be set to one of the following values: • no: Command authorization is disabled. User is granted access to CLI
	commands according to his privilege level.
	tacacs: Use remote <u>TACACS+</u> server(s) for command authorization. If
	all remote servers are offline, the user is granted access to CLI
	commands according to his privilege leve
Cmd Lvl	Authorize all commands with a privilege level higher than or equal to this level.
	Valid values are in the range 0 to 15.
Cfg Cmd	Also authorize configuration commands

Accounting Method Configuration

The accounting section allows you to configure command and exec (login) accounting.

The table has one row for each client type and a number of columns, which are:

Object	Description			
• Client	The management client for which the configuration below applies.			
• Methods	Method can be set to one of the following values:			
	no: Accounting is disabled.			
	tacacs: Use remote <u>TACACS+</u> server(s) for accounting.			
Cmd Lvl	Enable accounting of all commands with a privilege level higher than or equal to this level.			
	Valid values are in the range 0 to 15. Leave the field empty to disable command accounting.			
• Exec	Enable exec (login) accounting.			

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.2.2 RADIUS

This page allows you to configure the RADIUS Servers. The RADIUS Configuration screen in Figure 4-5-2-4 appears.

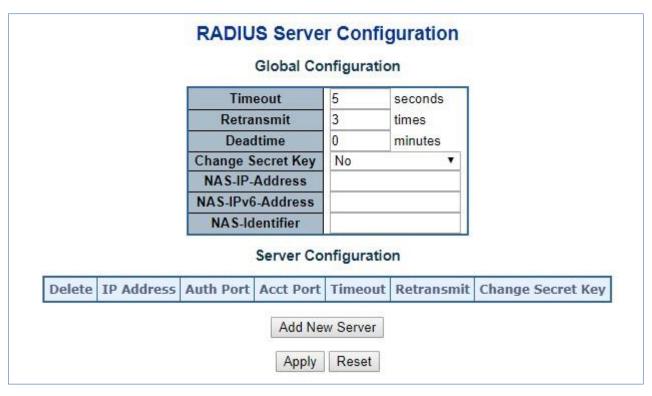

Figure 4-5-2-4: RADIUS Server Configuration Page Screenshot

The page includes the following fields:

Global Configuration

These setting are common for all of the RADIUS Servers.

Object	Description			
• Timeout	Timeout is the number of seconds, in the range 1 to 1000, to wait for a reply			
	from a RADIUS server before retransmitting the request.			
Retransmit	Retransmit is the number of times, in the range from 1 to 1000; a RADIUS			
	request is retransmitted to a server that is not responding. If the server has not			
	responded after the last retransmit, it is considered to be dead.			
Dead Time	The Dead Time, which can be set to a number between 0 and 3600 seconds, is			
	the period during which the switch will not send new requests to a server that			
	has failed to respond to a previous request. This will stop the switch from			
	continually trying to contact a server that it has already determined as dead.			
	Setting the Dead Time to a value greater than 0 (zero) will enable this feature,			
	but only if more than one server has been configured.			
• Key	The secret key - up to 63 characters long - shared between the RADIUS server			

	and the switch.
NAS-IP-Address	The IPv4 address to be used as attribute 4 in RADIUS Access-Request packets. If this field is left blank, the IP address of the outgoing interface is used.
NAS-IPv6-Address	The IPv6 address to be used as attribute 95 in RADIUS Access-Request packets. If this field is left blank, the IP address of the outgoing interface is used.
NAS-Identifier	The identifier - up to 253 characters long - to be used as attribute 32 in RADIUS Access-Request packets. If this field is left blank, the NAS-Identifier is not included in the packet.

Server Configuration

The table has one row for each RADIUS Server and a number of columns, which are:

Object	Description		
• Delete	To delete a RADIUS server entry, check this box. The entry will be deleted		
	during the next Save.		
Hostname	The IP address or hostname of the RADIUS server.		
Auth Port	The UDP port to use on the RADIUS server for authentication.		
Acct Port	The UDP port to use on the RADIUS server for accounting.		
• Timeout	This optional setting overrides the global timeout value. Leaving it blank will us		
	the global timeout value.		
Retransmit	This optional setting overrides the global retransmit value. Leaving it blank will		
	use the global retransmit value.		
• Key	This optional setting overrides the global key. Leaving it blank will use the global		
	key.		

Buttons

Add New Server: Click to add a new RADIUS server. An empty row is added to the table, and the RADIUS server can be configured as needed. Up to 5 servers are supported.

Delete : Click to undo the addition of the new server.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.2.3 TACACS+

This page allows you to configure the TACACS+ Servers. The TACACS+ Configuration screen in Figure 4-5-2-5 appears.

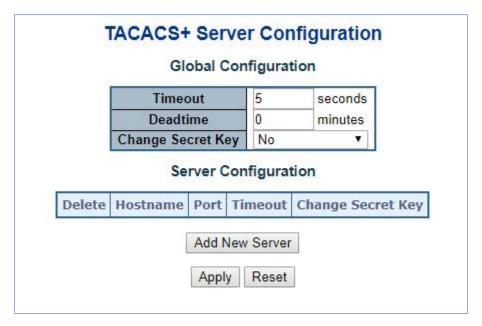

Figure 4-5-2-5: TACACS+ Server Configuration Page Screenshot

The page includes the following fields:

Global Configuration

These setting are common for all of the TACACS+ Servers.

Object	Description			
• Timeout	Timeout is the number of seconds, in the range 1 to 1000, to wait for a reply			
	from a TACACS+ server before it is considered to be dead.			
Dead Time	The Dead Time, which can be set to a number between 0 to 1440 minutes, is			
	the period during which the switch will not send new requests to a server that			
	has failed to respond to a previous request. This will stop the switch from			
	continually trying to contact a server that it has already determined as dead.			
	Setting the Dead Time to a value greater than 0 (zero) will enable this feature,			
	but only if more than one server has been configured.			
• Key	Specify to change the secret key or not. When "Yes" is selected for the option,			
	you can change the secret key - up to 63 characters long - shared between the			
	TACACS+ server and the switch.			

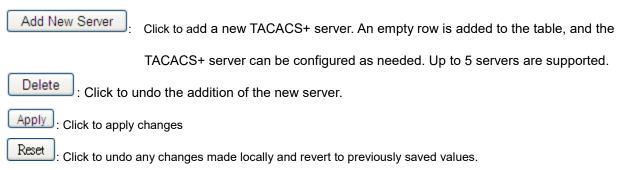

Server Configuration

The table has one row for each TACACS+ server and a number of columns, which are:

Object	Description			
• Delete	To delete a TACACS+ server entry, check this box. The entry will be deleted durin			
	the next Save.			
Hostname	The IP address or hostname of the TACACS+ server.			
• Port	The TCP port to use on the TACACS+ server for authentication.			
Timeout This optional setting overrides the global timeout value. Leaving it blank will				
	global timeout value.			
Key This optional setting overrides the global key. Leaving it blank will use the glo				

Buttons

4.5.2.4 RADIUS Overview

This page provides an overview of the status of the RADIUS servers configurable on the authentication configuration page. The RADIUS Authentication/Accounting Server Overview screen in Figure 4-5-2-6 appears.

#	IP Address	Authentication Port	Authentication Status	Accounting Port	Accounting Status
1		Disabled			Disabled
2	Disabled			Disabled	
3	Disabled			Disabled	
4	Disabled			Disabled	
2 3 4 5		Disabled			Disabled
		A	Auto-refresh Refres	sh	

Figure 4-5-2-6: RADIUS Authentication/Accounting Server Overview Page Screenshot

The page includes the following fields:

RADIUS Authentication Server Status Overview

Object	Description			
• #	The RADIUS server number. Click to navigate to detailed statistics for this server.			
IP Address	The IP address and UDP port number (in <ip address="">:<udp port=""> notation) of this serve</udp></ip>			
Authentication Port	<u> </u>			
Authentication	The current status of the server. This field takes one of the following values:			
Status	Disabled: The server is disabled.			
	Not Ready: The server is enabled, but IP communication is not yet up and running.			
	Ready: The server is enabled, IP communication is up and running, and the RADIUS			
	module is ready to accept access attempts.			
	Dead (X seconds left): Access attempts were made to this server, but it did not reply			
	within the configured timeout. The server has temporarily been disabled, but will get re-			
	enabled when the dead-time expires. The number of seconds left before this occurs is			
	displayed in parentheses. This state is only reachable when more than one server is			
	enabled.			
Accounting Port	UDP port number for accounting			
Accounting Status	The current status of the server. This field takes one of the following values:			
	Disabled: The server is disabled.			
	Not Ready: The server is enabled, but IP communication is not yet up and running.			
	Ready: The server is enabled, IP communication is up and running, and the RADIUS			
	module is ready to accept access attempts.			
	Dead (X seconds left): Access attempts were made to this server, but it did not reply			
	within the configured timeout. The server has temporarily been disabled, but will get re-			
	enabled when the dead-time expires. The number of seconds left before this occurs is			
	displayed in parentheses. This state is only reachable when more than one server is			
	enabled.			

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

4.5.2.5 RADIUS Details

This page provides detailed statistics for a particular RADIUS server. The RADIUS Authentication/Accounting for Server Overview screen in Figure 4-5-2-7 appears.

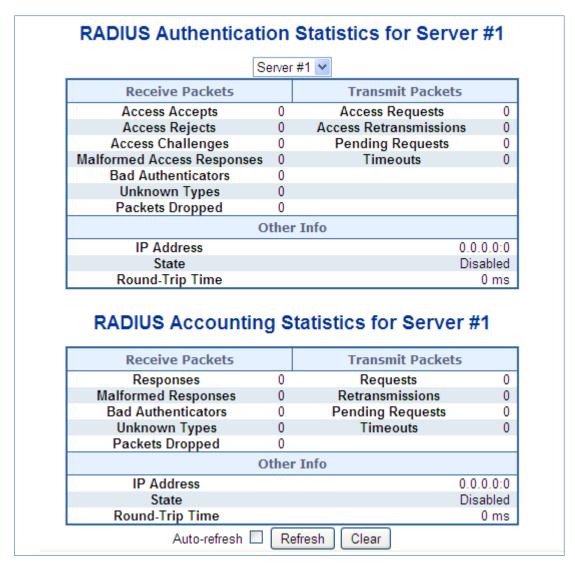

Figure 4-5-2-7: RADIUS Authentication/Accounting for Server Overview Screenshot

The page includes the following fields:

RADIUS Authentication Statistics

The statistics map closely to those specified in RFC4668 - RADIUS Authentication Client MIB. Use the server select box to switch between the backend servers to show details for.

Object	Description				
Packet Counters	RADIUS authentication server packet counter. There are seven receive and four transmit				
	counters.				
	Direction	Name	RFC4668 Name	Description	
	Rx	Access	radiusAuthClientExtA	The number of RADIUS	
		Accepts	ccessAccepts	Access-Accept packets (valid	
				or invalid) received from the	
				server.	
	Rx	Access Rejects	radiusAuthClientExtA	The number of RADIUS	
			ccessRejects	Access-Reject packets (valid	
				or invalid) received from the	
				server.	
	Rx	Access	radiusAuthClientExtA	The number of RADIUS	
		Challenges	ccessChallenges	Access-Challenge packets	
				(valid or invalid) received from	
				the server.	
	Rx	Malformed	radiusAuthClientExt	The number of malformed	
		Access	MalformedAccessRe	RADIUS Access-Response	
		Responses	sponses	packets received from the	
				server. Malformed packets	
				include packets with an invalid	
				length. Bad authenticators or	
				Message Authenticator	
				attributes or unknown types	
				are not included as malformed	
				access responses.	
	Rx	Bad	radiusAuthClientExtB	The number of RADIUS	
		Authenticators	adAuthenticators	Access-Response packets	
				containing invalid	
				authenticators or Message	
				Authenticator attributes	
				received from the server.	
	Rx	Unknown	radiusAuthClientExtU	The number of RADIUS	
		Types	nknownTypes	packets that were received	
				from the server on the	
				authentication port and	
				dropped for some other	

			reason.
Rx	Packets Dropped	radiusAuthClientExtP acketsDropped	The number of RADIUS packets that were received from the server on the authentication port and dropped for some other reason.
Тх	Access Requests	radiusAuthClientExtA ccessRequests	The number of RADIUS Access-Request packets sent to the server. This does not include retransmissions.
Тх	Access Retransmissio ns	radiusAuthClientExtA ccessRetransmission s	The number of RADIUS Access-Request packets retransmitted to the RADIUS authentication server.
Tx	Pending Requests	radiusAuthClientExtP endingRequests	The number of RADIUS Access-Request packets destined for the server that have not yet timed out or received a response. This variable is incremented when an Access-Request is sent and decremented due to receipt of an Access-Accept, Access-Reject, Access- Challenge, timeout, or retransmission.
Тх	Timeouts	radiusAuthClientExtT imeouts	The number of authentication timeouts to the server. After a timeout, the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a

			timeout.		
Other Info	This section contains information about the state of the server and the latest round-trip time.				
	Name	RFC4668 Name	Description		
	IP Address	-	IP address and UDP port for the authentication server in question.		
	State		Shows the state of the server. It takes one of the following values: Disabled: The selected server is disabled. Not Ready: The server is enabled, but IP communication is not yet up and running. Ready: The server is enabled, IP communication is up and running, and the RADIUS module is ready to accept access attempts. Dead (X seconds left): Access attempts were made to this server, but it did not reply within the configured timeout. The server has temporarily been disabled, but will get re-enabled when the dead-time expires. The number of seconds left before this occurs is displayed in parentheses. This state is only reachable when more than one server is enabled.		
	Round-Trip Time	radiusAuthClient ExtRoundTripTim e	The time interval (measured in milliseconds) between the most recent Access-Reply/Access- Challenge and the Access-Request that matched it from the RADIUS authentication server. The granularity of this measurement is 100 ms. A value of 0 ms indicates that there hasn't been round-trip communication with the server yet.		

RADIUS Accounting Statistics

The statistics map closely to those specified in RFC4670 - RADIUS Accounting Client MIB. Use the server select box to switch between the backend servers to show details for.

Object	Description
Packet Counters	RADIUS accounting server packet counter. There are five receive and four transmit
	counters.

Direction	Name	RFC4670 Name	Description
Rx Rx	Responses Malformed	radiusAccClientExt Responses radiusAccClientExt	The number of RADIUS packets (valid or invalid) received from the server. The number of malformed
	Responses	MalformedRespons es	RADIUS packets received from the server. Malformed packets include packets with an invalid length. Bad authenticators or unknown types are not included as malformed access responses.
Rx	Bad Authenticators	radiusAcctClientExt BadAuthenticators	The number of RADIUS packets containing invalid authenticators received from the server.
Rx	Unknown Types	radiusAccClientExt UnknownTypes	The number of RADIUS packets of unknown types that were received from the server on the accounting port.
Rx	Packets Dropped	radiusAccClientExt PacketsDropped	The number of RADIUS packets that were received from the server on the accounting port and dropped for some other reason.
Tx	Requests	radiusAccClientExt Requests	The number of RADIUS packets sent to the server. This does not include retransmissions.
Тх	Retransmissions	radiusAccClientExt Retransmissions	The number of RADIUS packets retransmitted to the RADIUS accounting server.
Тх	Pending Requests	radiusAccClientExt PendingRequests	The number of RADIUS packets destined for the server that have not yet timed out or received a response.

					This variable is incremented when a Request is sent and decremented due to receipt of a Response, timeout, or retransmission.
	Tx T	imeouts	radius,	AccClientExt uts	The number of accounting timeouts to the server. After a timeout, the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout.
Other Info	This section co	ontains information	about th	ne state of the s	server and the latest round-trip
	Name	RFC4670 Name		Description	
	IP Address	-		IP address and server in quest	UDP port for the accounting ion.
	State	-		Shows the stat	e of the server. It takes one of
				the following va	alues:
				■ Disabled:	The selected server is
				disabled.	
				■ Not Ready	: The server is enabled, but IP
					ation is not yet up and running.
					e server is enabled, IP
					ation is up and running, and the
				accounting	nodule is ready to accept
					econds left): Accounting
					vere made to this server, but it
				did not rep	ly within the configured
				timeout. Th	ne server has temporarily been
				disabled, b	out will get re-enabled when the
					expires. The number of
					ft before this occurs is
				displayed i	n parentheses. This state is

			only reachable when more than one server is enabled.

4.5.3 Port Authentication

4.5.3.1 Network Access Server Configuration

This page allows you to configure the IEEE 802.1X and MAC-based authentication system and port settings.

The IEEE 802.1X standard defines a port-based access control procedure that prevents unauthorized access to a network by requiring users to first submit credentials for authentication. One or more central servers, the backend servers, determine whether the user is allowed access to the network. These backend (RADIUS) servers are configured on the "Configuration—Security—AAA" Page. The IEEE802.1X standard defines port-based operation, but non-standard variants overcome security limitations as shall be explored below.

MAC-based authentication allows for authentication of more than one user on the same port, and doesn't require the user to have special 802.1X supplicant software installed on his system. The switch uses the user's MAC address to authenticate against the backend server. Intruders can create counterfeit MAC addresses, which makes MAC-based authentication less secure than 802.1X authentication. The NAS configuration consists of two sections, a system- and a port-wide. The Network Access Server Configuration screen in Figure 4-5-3-1 appears.

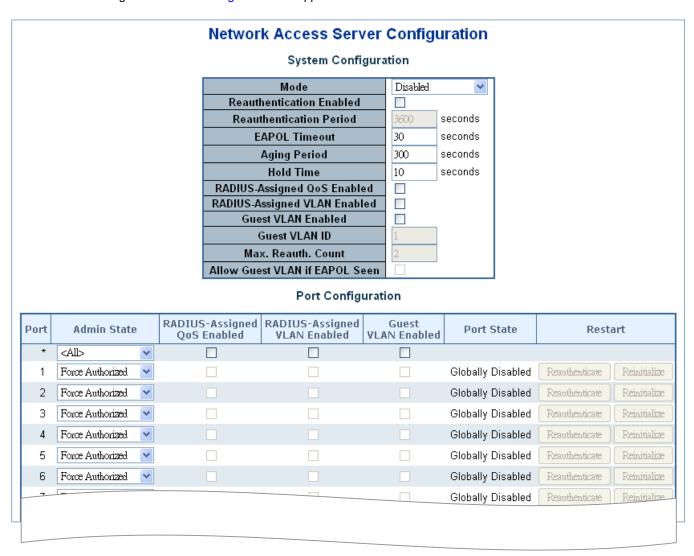

Figure 4-5-3-1: Network Access Server Configuration Page Screenshot

The page includes the following fields:

System Configuration

Object	Description
• Mode	Indicates if NAS is globally enabled or disabled on the switch. If globally
	disabled, all ports are allowed forwarding of frames.
Reauthentication	If checked, successfully authenticated supplicants/clients are reauthenticated
Enabled	after the interval specified by the Reauthentication Period. Reauthentication for
	802.1X-enabled ports can be used to detect if a new device is plugged into a
	switch port or if a supplicant is no longer attached.
	For MAC-based ports, reauthentication is only useful if the RADIUS server
	configuration has changed. It does not involve communication between the
	switch and the client, and therefore doesn't imply that a client is still present on a
	port.
Reauthentication	Determines the period, in seconds, after which a connected client must be
Period	reauthenticated. This is only active if the Reauthentication Enabled checkbox is
	checked. Valid values are in the range 1 to 3600 seconds.
EAPOL Timeout	Determines the time for retransmission of Request Identity EAPOL frames.
	Valid values are in the range 1 to 65535 seconds. This has no effect for MAC-
	based ports.
Aging Period	This setting applies to the following modes, i.e. modes using the Port Security
	functionality to secure MAC addresses:
	Single 802.1X
	Multi 802.1X
	MAC-Based Auth.
	When the NAS module uses the Port Security module to secure MAC
	addresses, the Port Security module needs to check for activity on the MAC
	address in question at regular intervals and free resources if no activity is seen
	within a given period of time. This parameter controls exactly this period and can
	be set to a number between 10 and 1000000 seconds.
	If reauthentication is enabled and the port is in a 802.1X-based mode, this is not
	so critical, since supplicants that are no longer attached to the port will get
	removed upon the next reauthentication, which will fail. But if reauthentication is
	not enabled, the only way to free resources is by aging the entries.
	For ports in MAC-based Auth. mode, reauthentication doesn't cause direct
	communication between the switch and the client, so this will not detect whether
	the client is still attached or not, and the only way to free any resources is to age

	the entry.
Hold Time	This setting applies to the following modes, i.e. modes using the Port Security
	functionality to secure MAC addresses:
	■ Single 802.1X
	Multi 802.1X
	MAC-Based Auth.
	If a client is denied access, either because the RADIUS server denies the client
	access or because the RADIUS server request times out (according to the
	timeout specified on the "Configuration→Security→AAA" page), the client is put
	on hold in the Unauthorized state. The hold timer does not count during an on-
	going authentication.
	In MAC-based Auth. mode, the switch will ignore new frames coming from the
	client during the hold time.
	The Hold Time can be set to a number between 10 and 1000000 seconds.
 RADIUS-Assigned 	RADIUS-assigned QoS provides a means to centrally control the traffic class to
QoS Enabled	which traffic coming from a successfully authenticated supplicant is assigned on
	the switch. The RADIUS server must be configured to transmit special RADIUS
	attributes to take advantage of this feature.
	The "RADIUS-Assigned QoS Enabled" checkbox provides a quick way to
	globally enable/disable RADIUS-server assigned QoS Class functionality. When
	checked, the individual ports' ditto setting determines whether RADIUS-
	assigned QoS Class is enabled for that port. When unchecked, RADIUS-server
	assigned QoS Class is disabled for all ports.
RADIUS-Assigned	RADIUS-assigned VLAN provides a means to centrally control the VLAN on
VLAN Enabled	which a successfully authenticated supplicant is placed on the switch. Incoming
	traffic will be classified to and switched on the RADIUS-assigned VLAN. The
	RADIUS server must be configured to transmit special RADIUS attributes to
	take advantage of this feature.
	The "RADIUS-Assigned VLAN Enabled" checkbox provides a quick way to
	globally enable/disable RADIUS-server assigned VLAN functionality. When
	checked, the individual ports' ditto setting determines whether RADIUS-
	assigned VLAN is enabled for that port. When unchecked, RADIUS-server
	assigned VLAN is disabled for all ports.
Guest VLAN Enabled	A Guest VLAN is a special VLAN - typically with limited network access - on
	which 802.1X-unaware clients are placed after a network administrator-defined
	timeout. The switch follows a set of rules for entering and leaving the Guest

	VLAN as listed below.
	The "Guest VLAN Enabled" checkbox provides a quick way to globally enable/disable Guest VLAN functionality. When checked, the individual ports' ditto setting determines whether the port can be moved into Guest VLAN. When
	unchecked, the ability to move to the Guest VLAN is disabled for all ports.
Guest VLAN ID	This is the value that a port's Port VLAN ID is set to if a port is moved into the Guest VLAN. It is only changeable if the Guest VLAN option is globally enabled. Valid values are in the range [1; 4095].
Max. Reauth. Count	The number of times that the switch transmits an EAPOL Request Identity frame without response before considering entering the Guest VLAN is adjusted with this setting. The value can only be changed if the Guest VLAN option is globally enabled. Valid values are in the range [1; 255].
Allow Guest VLAN if EAPOL Seen	The switch remembers if an EAPOL frame has been received on the port for the life-time of the port. Once the switch considers whether to enter the Guest VLAN, it will first check if this option is enabled or disabled. If disabled (unchecked; default), the switch will only enter the Guest VLAN if an EAPOL frame has not been received on the port for the life-time of the port. If enabled (checked), the switch will consider entering the Guest VLAN even if an EAPOL frame has been received on the port for the life-time of the port. The value can only be changed if the Guest VLAN option is globally enabled.

4.5.3.2 Network Access Overview

This page provides an overview of the current NAS port states for the selected switch. The Network Access Overview screen in Figure 4-5-3-2 appears.

Port	Admin State	Port State	Last Source	Last ID	QoS Class	Port VLAN ID
1	Force Authorized	Globally Disabled			-	
2	Force Authorized	Globally Disabled			-	
3	Force Authorized	Globally Disabled			-	
4	Force Authorized	Globally Disabled			-	
5	Force Authorized	Globally Disabled			-	
6	Force Authorized	Globally Disabled			-	
	_				-	

Figure 4-5-3-2: Network Access Server Switch Status Page Screenshot

The page includes the following fields:

Object	Description	
• Port	The switch port number. Click to navigate to detailed NAS statistics for this port.	
Admin State	The port's current administrative state. Refer to NAS Admin State for a	
	description of possible values.	
Port State	The current state of the port. Refer to NAS Port State for a description of the	
	individual states.	
Last Source	The source MAC address carried in the most recently received EAPOL frame for	
	EAPOL-based authentication, and the most recently received frame from a new	
,	client for MAC-based authentication.	
• Last ID	The user name (supplicant identity) carried in the most recently received	
	Response Identity EAPOL frame for EAPOL-based authentication, and the	
	source MAC address from the most recently received frame from a new client	
	for MAC-based authentication.	
QoS Class	QoS Class assigned to the port by the RADIUS server if enabled.	
Port VLAN ID	The VLAN ID that NAS has put the port in. The field is blank, if the Port VLAN ID	
	is not overridden by NAS.	
	If the VLAN ID is assigned by the RADIUS server, "(RADIUS-assigned)" is	
	appended to the VLAN ID. Read more about RADIUS-assigned VLANs here.	
	If the port is moved to the Guest VLAN, "(Guest)" is appended to the VLAN ID.	
	Read more about Guest VLANs here.

Refresh: Click to refresh the page immediately.

4.5.3.3 Network Access Statistics

This page provides detailed NAS statistics for a specific switch port running EAPOL-based IEEE 802.1X authentication. For MAC-based ports, it shows selected backend server (RADIUS Authentication Server) statistics, only. Use the port select box to select which port details to be displayed. The Network Access Statistics screen in Figure 4-5-3-3 appears.

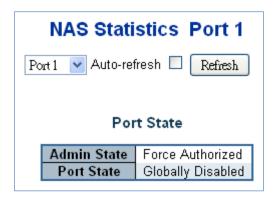

Figure 4-5-3-3: Network Access Statistics Page Screenshot

The page includes the following fields:

Port State

Object	Description
Admin State	The port's current administrative state. Refer to NAS Admin State for a
	description of possible values.
Port State	The current state of the port. Refer to NAS Port State for a description of the
	individual states.
QoS Class	The QoS class assigned by the RADIUS server. The field is blank if no QoS
	class is assigned.
Port VLAN ID	The VLAN ID that NAS has put the port in. The field is blank, if the Port VLAN ID
	is not overridden by NAS.
	If the VLAN ID is assigned by the RADIUS server, "(RADIUS-assigned)" is
	appended to the VLAN ID. Read more about RADIUS-assigned VLANs here.
	If the port is moved to the Guest VLAN, "(Guest)" is appended to the VLAN ID.
	Read more about Guest VLANs here.

Port Counters

Object	Descriptio	n		
EAPOL Counters	These sup	Force Authorized Force Unauthoriz Port-based 802.1X Multi 802.1X	ed	wing administrative states:
	Direction	Name	IEEE Name	Description
	Rx	Total	dot1xAuthEapolFrames Rx	The number of valid EAPOI frames of any type that have been received by the switch.
	Rx	Response ID	dot1xAuthEapolRespId FramesRx	The number of valid EAPOR Response Identity frames that have been received by the switch.
	Rx	Responses	dot1xAuthEapolRespFr amesRx	The number of valid EAPOR response frames (other than Response Identity frames) that have been received by the switch.
	Rx	Start	dot1xAuthEapolStartFra mesRx	The number of EAPOL Star frames that have been received by the switch.
	Rx	Logoff	dot1xAuthEapolLogoffFr amesRx	The number of valid EAPO Logoff frames that have been received by the switch.
	Rx	Invalid Type	dot1xAuthInvalidEapolF ramesRx	The number of EAPOL frames that have been received by the switch in which the frame type is not recognized.
	Rx	Invalid Length	dot1xAuthEapLengthErr	The number of EAPOL

		orFramesRx	frames that have been received by the switch in which the Packet Body
			Length field is invalid.
Тх	Total	dot1xAuthEapolFrames Tx	The number of EAPOL frames of any type that have been transmitted by the switch.
Тх	Request ID	dot1xAuthEapolReqIdFr amesTx	The number of EAPOL Request Identity frames that have been transmitted by the switch.
Тх	Requests	dot1xAuthEapolReqFra mesTx	The number of valid EAPOL Request frames (other than Request Identity frames) that have been transmitted by the switch.

Backend ServerCounters

These backend (RADIUS) frame counters are available for the following administrative states:

- Port-based 802.1X
- Single 802.1X
- Multi 802.1X
- MAC-based Auth.

Direction	Name	IEEE Name	Description
Rx	Access	dot1xAuthBackendAcce	802.1X-based:
	Challenges	ssChallenges	Counts the number of times
			that the switch receives the
			first request from the backend
			server following the first
			response from the supplicant.
			Indicates that the backend
			server has communication
			with the switch.
			MAC-based:
			Counts all Access Challenges
			received from the backend
			server for this port (left-most

			table) or client (right-most table).
Rx	Other	dot1xAuthBackendOther	802.1X-based:
	Requests	RequestsToSupplicant	Counts the number of times
			that the switch sends an EAP
			Request packet following the
			first to the supplicant.
			Indicates that the backend
			server chose an EAP-method.
			MAC-based:
			Not applicable.
Rx	Auth.	dot1xAuthBackendAuth	802.1X- and MAC-based:
	Successes	Successes	Counts the number of times
			that the switch receives a
			success indication. Indicates
			that the supplicant/client has
			successfully authenticated to
			the backend server.
Rx	Auth.	dot1xAuthBackendAuth	802.1X- and MAC-based:
	Failures	Fails	Counts the number of times
			that the switch receives a
			failure message. This
			indicates that the
			supplicant/client has not
			authenticated to the backend
			server.
Tx	Responses	dot1xAuthBackendResp	802.1X-based:
		onses	Counts the number of times
			that the switch attempts to
			send a supplicant's first
			response packet to the
			backend server. Indicates the
			switch attempted
			communication with the
			backend server. Possible
			retransmissions are not
			counted.
			MAC-based:
			Counts all the backend server
			packets sent from the switch

towards the backend server for a given port (left-most table) or client (right-most table). Possible retransmissions are not counted.

Last Supplicant/Client Info

Information about the last supplicant/client that attempted to authenticate. This information is available for the following administrative states:

- Port-based 802.1X
- Single 802.1X
- Multi 802.1X
- MAC-based Auth.

Name	IEEE Name	Description
MAC	dot1xAuthLastEapolF	The MAC address of the last supplicant/client.
Address	rameSource	
VLAN ID	-	The VLAN ID on which the last frame from the
		last supplicant/client was received.
Version	dot1xAuthLastEapolF	802.1X-based:
	rameVersion	The protocol version number carried in the most
		recently received EAPOL frame.
		MAC-based:
		Not applicable.
Identity	-	802.1X-based:
		The user name (supplicant identity) carried in
		the most recently received Response Identity
		EAPOL frame.
		MAC-based:
		Not applicable.

4.5.4 Port Security

4.5.4.1 Port Limit Control

This page allows you to configure the Port Security global and per-port settings.

Port Security allows for limiting the number of users on a given port. A user is identified by a MAC address and VLAN ID. If Port Security is enabled on a port, the limit specifies the maximum number of users on the port. If this number is exceeded, an action is taken depending on violation mode. The violation mode can be one of the four different described below.

The Port Security configuration consists of two sections, a global and a per-port.. The Port Limit Control Configuration screen in Figure 4-5-4-1 appears.

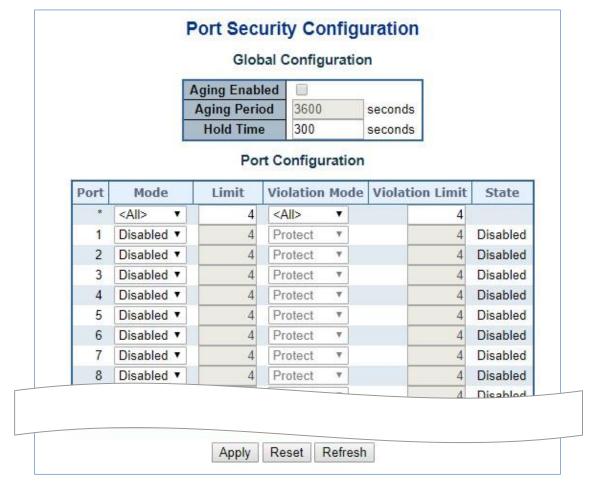

Figure 4-5-4-1: Port Limit Control Configuration Overview Page Screenshot

The page includes the following fields:

System Configuration

Object	Description
• Aging	If checked, secured MAC addresses are subject to aging as discussed under Aging
Enabled	Period.
Aging Period	If Aging Enabled is checked, then the aging period is controlled with this input. If other
	modules are using the underlying port security for securing MAC addresses, they may

have other requirements to the aging period. The underlying port security will use the shorter requested aging period of all modules that use the functionality. The Aging Period can be set to a number between 10 and 10,000,000 seconds. To understand why aging may be desired, consider the following scenario: Suppose an end-host is connected to a 3rd party switch or hub, which in turn is connected to a port on this switch on which Limit Control is enabled. The end-host will be allowed to forward if the limit is not exceeded. Now suppose that the end-host logs off or powers down. If it wasn't for aging, the end-host would still take up resources on this switch and will be allowed to forward. To overcome this situation, enable aging. With aging enabled, a timer is started once the end-host gets secured. When the timer expires, the switch starts looking for frames from the end-host, and if such frames are not seen within the next Aging Period, the end-host is assumed to be disconnected, and the corresponding resources are freed on the switch. Hold Time The hold time - measured in seconds - is used to determine how long a MAC address is held in the MAC table if it has been found to violate the limit. Valid range is between 10 and 10000000 seconds with a default of 300 seconds. The reason for holding a violating MAC address in the MAC table is primarily to ensure that the same MAC address doesn't give rise to continuous notifications (if notifications on violation count is enabled).

Port Configuration

The table has one row for each port and a number of columns, which are:

Object	Description
• Port	The port number for which the configuration below applies.
• Mode	Controls whether Limit Control is enabled on this port. Both this and the Global Mode
	must be set to Enabled for Limit Control to be in effect. Notice that other modules may still
	use the underlying port security features without enabling Limit Control on a given port.
• Limit	The maximum number of MAC addresses that can be secured on this port. This number
	cannot exceed 1024. If the limit is exceeded, the corresponding action is taken.
	The switch is "born" with a total number of MAC addresses from which all ports draw
	The switch is both with a total number of white addresses from which all ports draw
	whenever a new MAC address is seen on a Port Security-enabled port. Since all ports
	draw from the same pool, it may happen that a configured maximum cannot be granted, if
	the remaining ports have already used all available MAC addresses.

ViolationMode

If Limit is reached, the switch can take one of the following actions:

Protect: Do not allow more than Limit MAC addresses on the port, but take no further action.

Restrict: If Limit is reached, subsequent MAC addresses on the port will be counted and marked as violating. Such MAC addresses are removed from the MAC table when the hold time expires. At most Violation Limit MAC addresses can be marked as violating at any given time.

Shutdown: If Limit is reached, one additional MAC address will cause the port to be shut down. This implies that all secured MAC addresses be removed from the port, and no new addresses be learned. There are three ways to re-open the port:

- 1) In the "Configuration→Ports" page's "Configured" column, first disable the port, then restore the original mode.
- 2) Make a Port Security configuration change on the port.
- 3) Boot the switch.

Violation Limit

■ The maximum number of MAC addresses that can be marked as violating on this port. This number cannot exceed 1024. Default is 4. It is only used when Violation Mode is **Restrict**.

State

This column shows the current state of the port as seen from the Limit Control's point of view. The state takes one of four values:

- Disabled: Limit Control is either globally disabled or disabled on the port.
- Ready: The limit is not yet reached. This can be shown for all actions.
- Limit Reached: Indicates that the limit is reached on this port. This state can only be shown if Action is set to None or Trap.

Shutdown: Indicates that the port is shut down by the Limit Control module. This state can only be shown if Action is set to **Shutdown** or **Trap & Shutdown**.

Reset: Click to undo any changes made locally and revert to previously saved values.

Refresh: Click to refresh the page. Note that non-committed changes will be lost.

4.5.4.2 Port Security Status

This page shows the Port Security status. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise.

The status page is divided into two sections - one with a legend of user modules and one with the actual port status. The Port Security Status screen in Figure 4-5-4-2 appears.

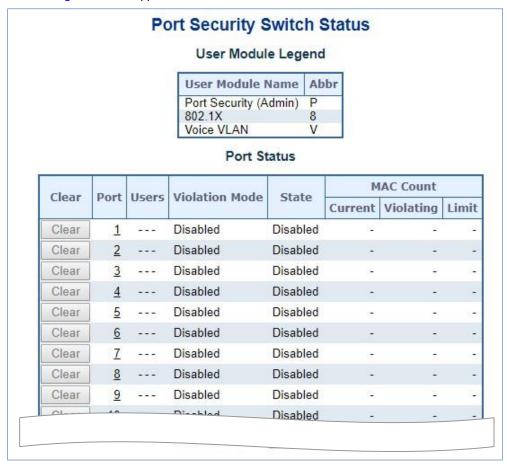

Figure 4-5-4-2: Port Security Status Screen Page Screenshot

The page includes the following fields:

User Module Legend

The legend shows all user modules that may request Port Security services.

Object	Description
User Module Name	The full name of a module that may request Port Security services.
• Abbr	A one-letter abbreviation of the user module. This is used in the Users column in
	the port status table.

Port Status

The table has one row for each port on the selected switch in the switch and a number of columns, which are:

Object	Description	
• Clear	Click to remove all MAC addresses on all VLANs on this port. The button is only	
	clickable if number of secured MAC addresses is non-zero.	
• Port	The port number for which the status applies. Click the port number to see the	
	status for this particular port.	
• Users	Each of the user modules has a column that shows whether that module has	
	enabled Port Security or not. A '-' means that the corresponding user module is	
	not enabled, whereas a letter indicates that the user module abbreviated by that	
	letter has enabled port security.	
Violation Mode	Shows the configured Violation Mode of the port. It can take one of four values:	
	Disabled : Port Security is not administratively enabled on this port.	
	Protect: Port Security is administratively enabled in Protect mode.	
	Restrict: Port Security is administratively enabled in Restrict mode.	
	Shutdown: Port Security is administratively enabled in Shutdown mode.	
• State	Shows the current state of the port. It can take one of four values:	
	■ Disabled : No user modules are currently using the Port Security service.	
	■ Ready: The Port Security service is in use by at least one user module, and	
	is awaiting frames from unknown MAC addresses to arrive.	
	■ Limit Reached: The Port Security service is enabled by at least the Limit	
	Control user module, and that module has indicated that the limit is reached	
	and no more MAC addresses should be taken in.	
	■ Shutdown: The Port Security service is enabled by at least the Limit	
	Control user module, and that module has indicated that the limit is	
	exceeded. No MAC addresses can be learned on the port until it is	
	administratively re-opened on the Limit Control configuration web page.	
MAC Count	The two columns indicate the number of currently learned MAC addresses	
(Current, Limit)	(forwarding as well as blocked) and the maximum number of MAC addresses	
	that can be learned on the port, respectively.	
	If no user modules are enabled on the port, the Current column will show a dash	
	(-).	
	If the Limit Control user module is not enabled on the port, the Limit column will	
	show a dash (-).

4.5.4.3 Port Security Detail

This page shows the MAC addresses secured by the Port Security module. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise. The Port Security Detail screen in Figure 4-5-4-3 appears.

Figure 4-5-4-3: Port Security Detail Screen Page Screenshot

The page includes the following fields:

Object	Description	
MAC Address & VLAN	The MAC address and VLAN ID that is seen on this port. If no MAC addresses	
ID	are learned, a single row stating "No MAC addresses attached" is displayed.	
• State	Indicates whether the corresponding MAC address is blocked or forwarding. In	
	the blocked state, it will not be allowed to transmit or receive traffic.	
Time of Addition	Shows the date and time when this MAC address was first seen on the port.	
Age/Hold	If at least one user module has decided to block this MAC address, it will	
	stay in the blocked state until the hold time (measured in seconds) expires.	
	If all user modules have decided to allow this MAC address to forward, and	
	aging is enabled, the Port Security module will periodically check that this	
	MAC address still forwards traffic.	
	If the age period (measured in seconds) expires and no frames have been	
	seen, the MAC address will be removed from the MAC table. Otherwise a	
	new age period will begin.	
	If aging is disabled or a user module has decided to hold the MAC address	
	indefinitely, a dash (-) will be shown.	

4.5.5 Access Control Lists

ACL is an acronym for Access Control List. It is the list table of ACEs, containing access control entries that specify individual users or groups permitted or denied to specific traffic objects, such as a process or a program.

Each accessible traffic object contains an identifier to its ACL. The privileges determine whether there are specific traffic object access rights.

ACL implementations can be quite complex, for example, when the ACEs are prioritized for the various situation. In networking, the ACL refers to a list of service ports or network services that are available on a host or server, each with a list of hosts or servers permitted or denied to use the service. ACL can generally be configured to control inbound traffic, and in this context, they are similar to firewalls.

ACE is an acronym for **Access Control Entry**. It describes access permission associated with a particular ACE ID. There are three ACE frame types (**Ethernet Type**, **ARP**, and **IPv4**) and two ACE actions (**permit** and **deny**). The ACE also contains many detailed, different parameter options that are available for individual application.

4.5.5.1 Access Control List Status

This page shows the ACL status by different ACL users. Each row describes the ACE that is defined. It is a conflict if a specific ACE is not applied to the hardware due to hardware limitations. The maximum number of ACEs is **512** on each switch. The Voice VLAN OUI Table screen in Figure 4-5-5-1 appears.

Figure 4-5-5-1: ACL Status Page Screenshot

The page includes the following fields:

Object	Description	
• User	Indicates the ACL user.	
• ACE	Indicates the ACE ID on local switch.	
Frame Type	Indicates the frame type of the ACE. Possible values are:	
	■ Any: The ACE will match any frame type.	
	■ EType: The ACE will match Ethernet Type frames. Note that an	
	Ethernet Type based ACE will not get matched by IP and ARP	

	frames.	
	■ ARP: The ACE will match ARP/RARP frames.	
	■ IPv4: The ACE will match all IPv4 frames.	
	■ IPv4/ICMP: The ACE will match IPv4 frames with ICMP protocol.	
	■ IPv4/UDP: The ACE will match IPv4 frames with UDP protocol.	
	■ IPv4/TCP: The ACE will match IPv4 frames with TCP protocol.	
	■ IPv4/Other: The ACE will match IPv4 frames, which are not	
	ICMP/UDP/TCP.	
	■ IPv6: The ACE will match all IPv6 standard frames.	
• Action	Indicates the forwarding action of the ACE.	
	■ Permit: Frames matching the ACE may be forwarded and learned.	
	■ Deny: Frames matching the ACE are dropped.	
Rate Limiter	Indicates the rate limiter number of the ACE. The allowed range is 1 to 16. When	
	Disabled is displayed, the rate limiter operation is disabled.	
• CPU	Forward packet that matched the specific ACE to CPU	
Counter	The counter indicates the number of times the ACE was hit by a frame.	
• Conflict	Indicates the hardware status of the specific ACE. The specific ACE is not	
	applied to the hardware due to hardware limitations.

4.5.5.2 Access Control List Configuration

This page shows the Access Control List (ACL), which is made up of the ACEs defined on this switch. Each row describes the ACE that is defined. The maximum number of ACEs is **512** on each switch.

Click on the lowest plus sign to add a new ACE to the list. The reserved ACEs used for internal protocol, cannot be edited or deleted, the order sequence cannot be changed and the priority is highest. The Access Control List Configuration screen in Figure 4-5-5-2 appears.

Figure 4-5-5-2: Access Control List Configuration Page Screenshot

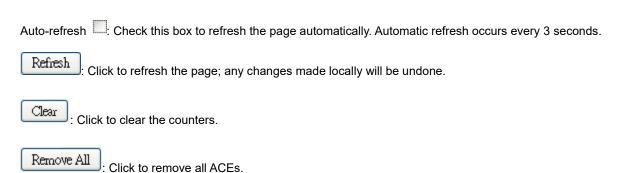

The page includes the following fields:

Object	Description
• ACE	Indicates the ACE ID.
Ingress Port	Indicates the ingress port of the ACE. Possible values are:
	■ All: The ACE will match all ingress port.
	Port: The ACE will match a specific ingress port.
Policy / Bitmask	Indicates the policy number and bitmask of the ACE.
Frame Type	Indicates the frame type of the ACE. Possible values are:
	■ Any: The ACE will match any frame type.
	■ EType: The ACE will match Ethernet Type frames. Note that an
	Ethernet Type based ACE will not get matched by IP and ARP
	frames.
	■ ARP: The ACE will match ARP/RARP frames.
	■ IPv4: The ACE will match all IPv4 frames.
	■ IPv4/ICMP: The ACE will match IPv4 frames with ICMP protocol.
	■ IPv4/UDP: The ACE will match IPv4 frames with UDP protocol.
	■ IPv4/TCP: The ACE will match IPv4 frames with TCP protocol.
	■ IPv4/Other: The ACE will match IPv4 frames, which are not
	ICMP/UDP/TCP.
	■ IPv6: The ACE will match all IPv6 standard frames.
• Action	Indicates the forwarding action of the ACE.
	Permit: Frames matching the ACE may be forwarded and learned.
	■ Deny : Frames matching the ACE are dropped.

	■ Filter: Frames matching the ACE are filtered.
Rate Limiter	Indicates the rate limiter number of the ACE. The allowed range is 1 to 16. When
	Disabled is displayed, the rate limiter operation is disabled.
Port Redirect	Indicates the port redirect operation of the ACE. Frames matching the ACE are
	redirected to the port number.
	The allowed values are Disabled or a specific port number. When Disabled is
	displayed, the port redirect operation is disabled.
• Mirror	pecify the mirror operation of this port. Frames matching the ACE are mirrored to
	the destination mirror port. The allowed values are:
	Enabled: Frames received on the port are mirrored.
	Disabled : Frames received on the port are not mirrored.
	The default value is "Disabled".
• Counter	The counter indicates the number of times the ACE was hit by a frame.
Modification Buttons	You can modify each ACE (Access Control Entry) in the table using the following
	buttons:
	⊕: Inserts a new ACE before the current row.
	e: Edits the ACE row.
	①: Moves the ACE up the list.
	Moves the ACE down the list.
	😸: Deletes the ACE.
	⊕: The lowest plus sign adds a new entry at the bottom of the ACE listings.

Buttons

4.5.5.3 ACE Configuration

Configure an **ACE** (**Access Control Entry**) on this page. An ACE consists of several parameters. These parameters vary according to the frame type that you select. First select the ingress port for the ACE, and then select the frame type. Different parameter options are displayed depending on the frame type selected. A frame that hits this ACE matches the configuration that is defined here. The ACE Configuration screen in Figure 4-5-5-3 appears.

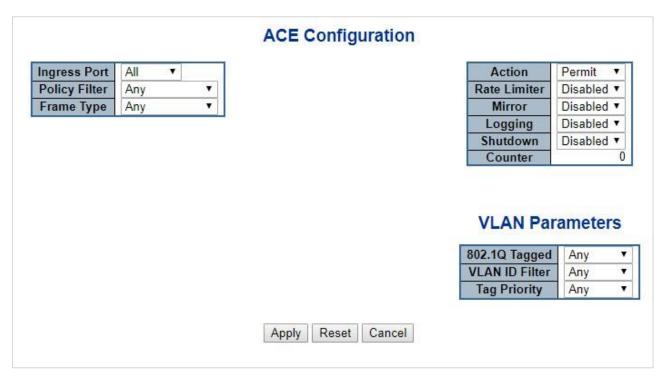

Figure 4-5-5-3: ACE Configuration Page Screenshot

The page includes the following fields:

Object	Description
Ingress Port	Select the ingress port for which this ACE applies.
	■ Any: The ACE applies to any port.
	■ Port n: The ACE applies to this port number, where n is the number of the
	switch port.
Policy Filter	Specify the policy number filter for this ACE.
	■ Any: No policy filter is specified. (policy filter status is "don't-care".)
	■ Specific: If you want to filter a specific policy with this ACE, choose this
	value. Two field for entering an policy value and bitmask appears.
Policy Value	When "Specific" is selected for the policy filter, you can enter a specific policy value.
	The allowed range is 0 to 255 .
Policy Bitmask	When "Specific" is selected for the policy filter, you can enter a specific policy bitmask.
	The allowed range is 0x0 to 0xff .
Frame Type	Select the frame type for this ACE. These frame types are mutually exclusive.
	■ Any: Any frame can match this ACE.

	■ Ethernet Type: Only Ethernet Type frames can match this ACE. The IEEE
	802.3 describes the value of Length/Type Field specifications to be greater
	than or equal to 1536 decimal (equal to 0600 hexadecimal).
	■ ARP: Only ARP frames can match this ACE. Notice the ARP frames won't
	match the ACE with Ethernet type.
	■ IPv4: Only IPv4 frames can match this ACE. Notice the IPv4 frames won't
	match the ACE with Ethernet type.
	■ IPv6: Only IPv6 frames can match this ACE. Notice the IPv6 frames won't
	match the ACE with Ethernet type.
• Action	Specify the action to take with a frame that hits this ACE.
	■ Permit: The frame that hits this ACE is granted permission for the ACE
	operation.
	■ Deny: The frame that hits this ACE is dropped.
Rate Limiter	Specify the rate limiter in number of base units.
	The allowed range is 1 to 16.
	Disabled indicates that the rate limiter operation is disabled.
Port Redirect	Frames that hit the ACE are redirected to the port number specified here.
	The allowed range is the same as the switch port number range.
	Disabled indicates that the port redirect operation is disabled.
• Mirror	Specify the mirror operation of this port. Frames matching the ACE are mirrored to the
	destination mirror port. The rate limiter will not affect frames on the mirror port. The
	allowed values are:
	Enabled: Frames received on the port are mirrored.
	Disabled: Frames received on the port are not mirrored.
	The default value is "Disabled"
• Logging	Specify the logging operation of the ACE. The allowed values are:
	■ Enabled : Frames matching the ACE are stored in the System Log.
	■ Disabled : Frames matching the ACE are not logged.
	Note : The logging feature only works when the packet length is less than 1518(without
	VLAN tags) and the System Log memory size and logging rate is limited.
Shutdown	Specify the port shut down operation of the ACE. The allowed values are:
	Enabled : If a frame matches the ACE, the ingress port will be disabled.
	■ Disabled : Port shut down is disabled for the ACE.
	Note : The shutdown feature only works when the packet length is less than
	1518(without VLAN tags).
• Counter	The counter indicates the number of times the ACE was hit by a frame.

MAC Parameters

Object	Description	
SMAC Filter	(Only displayed when the frame type is Ethernet Type or ARP.)	
	Specify the source MAC filter for this ACE.	
	■ Any: No SMAC filter is specified. (SMAC filter status is "don't-care".)	
	Specific: If you want to filter a specific source MAC address with this ACE,	
	choose this value. A field for entering an SMAC value appears.	
SMAC Value	When "Specific" is selected for the SMAC filter, you can enter a specific source MAC	
	address. The legal format is "xx-xx-xx-xx-xx" or "xx.xx.xx.xx.xx" or "xxxxxxxxxxx" (x	
	is a hexadecimal digit). A frame that hits this ACE matches this SMAC value.	
DMAC Filter	Specify the destination MAC filter for this ACE.	
	■ Any: No DMAC filter is specified. (DMAC filter status is "don't-care".)	
	■ MC: Frame must be multicast.	
	■ BC: Frame must be broadcast.	
	■ UC: Frame must be unicast.	
	Specific: If you want to filter a specific destination MAC address with this ACE,	
	choose this value. A field for entering a DMAC value appears.	
DMAC Value	When "Specific" is selected for the DMAC filter, you can enter a specific destination MAC	
	address. The legal format is "xx-xx-xx-xx-xx" or "xx.xx.xx.xx.xx" or "xxxxxxxxxxx" (x	
	is a hexadecimal digit). A frame that hits this ACE matches this DMAC value.	

■ VLAN Parameters

Object	Description
• 802.1Q	Specify whether frames can hit the action according to the 802.1Q tagged. The allowed values
Tagged	are:
	Any: Any value is allowed ("don't-care").
	Enabled: Tagged frame only.
	Disabled: Untagged frame only.
	The default value is "Any".
VLAN ID	Specify the VLAN ID filter for this ACE.
Filter	■ Any: No VLAN ID filter is specified. (VLAN ID filter status is "don't-care".)
	Specific: If you want to filter a specific VLAN ID with this ACE, choose this value.
	A field for entering a VLAN ID number appears.
VLAN ID	When "Specific" is selected for the VLAN ID filter, you can enter a specific VLAN ID number.
	The allowed range is 1 to 4095. A frame that hits this ACE matches this VLAN ID value.
• Tag	Specify the tag priority for this ACE. A frame that hits this ACE matches this tag priority. The
Priority	allowed number range is 0 to 7. The value Any means that no tag priority is specified (tag
	priority is "don't-care".)

■ ARP Parameters

The ARP parameters can be configured when Frame Type "ARP" is selected.

Object	Description
ARP/RARP	Specify the available ARP/RARP opcode (OP) flag for this ACE.
	■ Any: No ARP/RARP OP flag is specified. (OP is "don't-care".)
	■ ARP: Frame must have ARP/RARP opcode set to ARP.
	■ RARP: Frame must have ARP/RARP opcode set to RARP.
	■ Other: Frame has unknown ARP/RARP Opcode flag.
Request/Reply	Specify the available ARP/RARP opcode (OP) flag for this ACE.
	■ Any: No ARP/RARP OP flag is specified. (OP is "don't-care".)
	■ Request: Frame must have ARP Request or RARP Request OP flag set.
	■ Reply: Frame must have ARP Reply or RARP Reply OP flag.
Sender IP Filter	Specify the sender IP filter for this ACE.
	■ Any: No sender IP filter is specified. (Sender IP filter is "don't-care".)
	Host: Sender IP filter is set to Host. Specify the sender IP address in the SIP
	Address field that appears.
	■ Network: Sender IP filter is set to Network. Specify the sender IP address
	and sender IP mask in the SIP Address and SIP Mask fields that appear.
Sender IP Address	When "Host" or "Network" is selected for the sender IP filter, you can enter a
	specific sender IP address in dotted decimal notation.
Sender IP Mask	When "Network" is selected for the sender IP filter, you can enter a specific sender
	IP mask in dotted decimal notation.
• Target IP Filter	Specify the target IP filter for this specific ACE.
	Any: No target IP filter is specified. (Target IP filter is "don't-care".)
	Host: Target IP filter is set to Host. Specify the target IP address in the
	Target IP Address field that appears.
	Network: Target IP filter is set to Network. Specify the target IP address and
	target IP mask in the Target IP Address and Target IP Mask fields that
	appear.
• Target IP Address	When "Host" or "Network" is selected for the target IP filter, you can enter a
	specific target IP address in dotted decimal notation.
Target IP Mask	When "Network" is selected for the target IP filter, you can enter a specific target IP
	mask in dotted decimal notation.
ARP Sender MAC	Specify whether frames can hit the action according to their sender hardware
Match	address field (SHA) settings.
	O: ARP frames where SHA is not equal to the SMAC address.
	1: ARP frames where SHA is equal to the SMAC address.
	■ Any: Any value is allowed ("don't-care").

RARP Target MAC	Specify whether frames can hit the action according to their target hardware
Match	address field (THA) settings.
	■ 0: RARP frames where THA is not equal to the SMAC address.
	■ 1: RARP frames where THA is equal to the SMAC address.
	■ Any: Any value is allowed ("don't-care").
• IP/Ethernet Length	Specify whether frames can hit the action according to their ARP/RARP hardware
	address length (HLN) and protocol address length (PLN) settings.
	■ 0: ARP/RARP frames where the HLN is equal to Ethernet (0x06) and the
	(PLN) is equal to IPv4 (0x04).
	■ 1: ARP/RARP frames where the HLN is equal to Ethernet (0x06) and the
	(PLN) is equal to IPv4 (0x04).
	■ Any: Any value is allowed ("don't-care").
• IP	Specify whether frames can hit the action according to their ARP/RARP hardware
	address space (HRD) settings.
	■ 0: ARP/RARP frames where the HLD is equal to Ethernet (1).
	■ 1: ARP/RARP frames where the HLD is equal to Ethernet (1).
	■ Any: Any value is allowed ("don't-care").
• Ethernet	Specify whether frames can hit the action according to their ARP/RARP protocol
	address space (PRO) settings.
	■ 0: ARP/RARP frames where the PRO is equal to IP (0x800).
	■ 1: ARP/RARP frames where the PRO is equal to IP (0x800).
	■ Any: Any value is allowed ("don't-care").

■ IP Parameters

The IP parameters can be configured when Frame Type "IPv4" is selected.

Object	Description
IP Protocol	Specify the IP protocol filter for this ACE.
Filter	Any: No IP protocol filter is specified ("don't-care").
	Specific: If you want to filter a specific IP protocol filter with this ACE, choose this
	value. A field for entering an IP protocol filter appears.
	■ ICMP: Select ICMP to filter IPv4 ICMP protocol frames. Extra fields for defining
	ICMP parameters will appear. These fields are explained later in this help file.
	■ UDP: Select UDP to filter IPv4 UDP protocol frames. Extra fields for defining UDP
	parameters will appear. These fields are explained later in this help file.
	■ TCP: Select TCP to filter IPv4 TCP protocol frames. Extra fields for defining TCP
	parameters will appear. These fields are explained later in this help file.
IP Protocol	When "Specific" is selected for the IP protocol value, you can enter a specific value. The
Value	allowed range is 0 to 255. A frame that hits this ACE matches this IP protocol value.

IP TTL	Specify the Time-to-Live settings for this ACE.
	zero : IPv4 frames with a Time-to-Live field greater than zero must not be able to
	match this entry.
	non-zero: IPv4 frames with a Time-to-Live field greater than zero must be able to
	match this entry.
	Any: Any value is allowed ("don't-care").
IP Fragment	Specify the fragment offset settings for this ACE. This involves the settings for the More
	Fragments (MF) bit and the Fragment Offset (FRAG OFFSET) field for an IPv4 frame.
	No: IPv4 frames where the MF bit is set or the FRAG OFFSET field is greater than
	zero must not be able to match this entry.
	Yes: IPv4 frames where the MF bit is set or the FRAG OFFSET field is greater than
	zero must be able to match this entry.
	Any: Any value is allowed ("don't-care").
• IP Option	Specify the options flag setting for this ACE.
	No: IPv4 frames where the options flag is set must not be able to match this entry.
	Yes: IPv4 frames where the options flag is set must be able to match this entry.
	Any: Any value is allowed ("don't-care").
SIP Filter	Specify the source IP filter for this ACE.
	Any: No source IP filter is specified. (Source IP filter is "don't-care".)
	Host: Source IP filter is set to Host. Specify the source IP address in the SIP
	Address field that appears.
	Network: Source IP filter is set to Network. Specify the source IP address and
	source IP mask in the SIP Address and SIP Mask fields that appear.
SIP Address	When "Host" or "Network" is selected for the source IP filter, you can enter a specific SIP
	address in dotted decimal notation.
SIP Mask	When "Network" is selected for the source IP filter, you can enter a specific SIP mask in
	dotted decimal notation.
• DIP Filter	Specify the destination IP filter for this ACE.
	Any: No destination IP filter is specified. (Destination IP filter is "don't-care".)
	Host: Destination IP filter is set to Host. Specify the destination IP address in the
	DIP Address field that appears.
	Network: Destination IP filter is set to Network. Specify the destination IP address
	and destination IP mask in the DIP Address and DIP Mask fields that appear.
• DIP Address	When "Host" or "Network" is selected for the destination IP filter, you can enter a specific
	DIP address in dotted decimal notation.
DIP Mask	When "Network" is selected for the destination IP filter, you can enter a specific DIP mask
	in dotted decimal notation.

■ IPv6 Parameters

Object	Description
Next Header Filter	Specify the IPv6 next header filter for this ACE.
	Any: No IPv6 next header filter is specified ("don't-care").
	Specific: If you want to filter a specific IPv6 next header filter with this
	ACE, choose this value. A field for entering an IPv6 next header filter
	appears.
	■ ICMP: Select ICMP to filter IPv6 ICMP protocol frames. Extra fields for
	defining ICMP parameters will appear. These fields are explained later in
	this help file.
	■ UDP: Select UDP to filter IPv6 UDP protocol frames. Extra fields for
	defining UDP parameters will appear. These fields are explained later in
	this help file.
	■ TCP: Select TCP to filter IPv6 TCP protocol frames. Extra fields for
	defining TCP parameters will appear. These fields are explained later in
	this help file.
Next Header Value	When "Specific" is selected for the IPv6 next header value, you can enter a
	specific value. The allowed range is 0 to 255 . A frame that hits this ACE matches
	this IPv6 protocol value.
SIP Filter	Specify the source IPv6 filter for this ACE.
	Any: No source IPv6 filter is specified. (Source IPv6 filter is "don't-care".)
	Specific: Source IPv6 filter is set to Network. Specify the source IPv6
	address and source IPv6 mask in the SIP Address fields that appear.
SIP Address	When "Specific" is selected for the source IPv6 filter, you can enter a specific
	SIPv6 address. The field only supported last 32 bits for IPv6 address.
SIP BitMask	When "Specific" is selected for the source IPv6 filter, you can enter a specific
	SIPv6 mask. The field only supported last 32 bits for IPv6 address. Notice the
	usage of bitmask, if the binary bit value is "0", it means this bit is "don't-care".
	The real matched pattern is [sipv6_address & sipv6_bitmask] (last 32 bits). For
	example, if the SIPv6 address is 2001::3 and the SIPv6 bitmask is
	0xFFFFFFE(bit 0 is "don't-care" bit), then SIPv6 address 2001::2 and 2001::3
	are applied to this rule.
Hop Limit	Specify the hop limit settings for this ACE.
	zero: IPv6 frames with a hop limit field greater than zero must not be able
	to match this entry.
	non-zero: IPv6 frames with a hop limit field greater than zero must be
	able to match this entry.
	■ Any: Any value is allowed ("don't-care").

■ ICMP Parameters

Object	Description	
ICMP Type Filter	Specify the ICMP filter for this ACE.	
	Any: No ICMP filter is specified (ICMP filter status is "don't-care").	
	Specific: If you want to filter a specific ICMP filter with this ACE, you can	
	enter a specific ICMP value. A field for entering an ICMP value appears.	
ICMP Type Value	When "Specific" is selected for the ICMP filter, you can enter a specific ICMP	
	value.	
	The allowed range is 0 to 255 . A frame that hits this ACE matches this ICMP	
	value.	
• ICMP Code Filter	Specify the ICMP code filter for this ACE.	
	Any: No ICMP code filter is specified (ICMP code filter status is "don't-	
	care").	
	Specific: If you want to filter a specific ICMP code filter with this ACE, you	
	can enter a specific ICMP code value. A field for entering an ICMP code	
	value appears.	
• ICMP Code Value	When "Specific" is selected for the ICMP code filter, you can enter a specific	
	ICMP code value.	
	The allowed range is 0 to 255 . A frame that hits this ACE matches this ICMP	
	code value.	

■ TCP/UDP Parameters

Object	Description	
TCP/UDP Source Filter	Specify the TCP/UDP source filter for this ACE.	
	■ Any: No TCP/UDP source filter is specified (TCP/UDP source filter status	
	is "don't-care").	
	■ Specific: If you want to filter a specific TCP/UDP source filter with this	
	ACE, you can enter a specific TCP/UDP source value. A field for entering	
	a TCP/UDP source value appears.	
	■ Range: If you want to filter a specific TCP/UDP source range filter with this	
	ACE, you can enter a specific TCP/UDP source range value. A field for	
	entering a TCP/UDP source value appears.	
TCP/UDP Source No.	When "Specific" is selected for the TCP/UDP source filter, you can enter a	
	specific TCP/UDP source value. The allowed range is 0 to 65535 . A frame that	
	hits this ACE matches this TCP/UDP source value.	
TCP/UDP Source	When "Range" is selected for the TCP/UDP source filter, you can enter a	
Range	specific TCP/UDP source range value. The allowed range is 0 to 65535 . A frame	
	that hits this ACE matches this TCP/UDP source value.	

TOP/UDD Destination	Charles the TCD/IIDD destination filter for this ACC	
TCP/UDP Destination	Specify the TCP/UDP destination filter for this ACE.	
Filter	Any: No TCP/UDP destination filter is specified (TCP/UDP destination	
	filter status is "don't-care").	
	Specific: If you want to filter a specific TCP/UDP destination filter with this	
	ACE, you can enter a specific TCP/UDP destination value. A field for	
	entering a TCP/UDP destination value appears.	
	Range: If you want to filter a specific range TCP/UDP destination filter with	
	this ACE, you can enter a specific TCP/UDP destination range value. A	
	field for entering a TCP/UDP destination value appears.	
 TCP/UDP Destination 	When "Specific" is selected for the TCP/UDP destination filter, you can enter a	
Number	specific TCP/UDP destination value. The allowed range is 0 to 65535 . A frame	
	that hits this ACE matches this TCP/UDP destination value.	
 TCP/UDP Destination 	When "Range" is selected for the TCP/UDP destination filter, you can enter a	
Range	specific TCP/UDP destination range value. The allowed range is 0 to 65535 . A	
	frame that hits this ACE matches this TCP/UDP destination value.	
TCP FIN	Specify the TCP "No more data from sender" (FIN) value for this ACE.	
	■ 0: TCP frames where the FIN field is set must not be able to match this	
	entry.	
	■ 1: TCP frames where the FIN field is set must be able to match this entry.	
	Any: Any value is allowed ("don't-care").	
TCP SYN	Specify the TCP "Synchronize sequence numbers" (SYN) value for this ACE.	
	■ 0: TCP frames where the SYN field is set must not be able to match this	
	entry.	
	■ 1: TCP frames where the SYN field is set must be able to match this entry.	
	■ Any: Any value is allowed ("don't-care").	
TCP RST	Specify the TCP "Reset the connection" (RST) value for this ACE.	
	■ 0: TCP frames where the RST field is set must not be able to match this	
	entry.	
	1: TCP frames where the RST field is set must be able to match this entry.	
	■ Any: Any value is allowed ("don't-care").	
TCP PSH	Specify the TCP "Push Function" (PSH) value for this ACE.	
	■ 0: TCP frames where the PSH field is set must not be able to match this	
	entry.	
	■ 1: TCP frames where the PSH field is set must be able to match this entry.	
	■ Any: Any value is allowed ("don't-care").	
TCP ACK	Specify the TCP "Acknowledgment field significant" (ACK) value for this ACE.	
	■ 0: TCP frames where the ACK field is set must not be able to match this	
	entry.	
	■ 1: TCP frames where the ACK field is set must be able to match this entry.	
	Any: Any value is allowed ("don't-care").	

TCP URG	Specify the TCP "Urgent Pointer field significant" (URG) value for this ACE.	
		0: TCP frames where the URG field is set must not be able to match this
		entry.
		1: TCP frames where the URG field is set must be able to match this entry.
		Any: Any value is allowed ("don't-care").

■ Ethernet Type Parameters

The Ethernet Type parameters can be configured when Frame Type "Ethernet Type" is selected.

Object	Description	
EtherType Filter	Specify the Ethernet type filter for this ACE.	
	■ Any: No EtherType filter is specified (EtherType filter status is "don't-	
	care").	
	■ Specific: If you want to filter a specific EtherType filter with this ACE, you	
	can enter a specific EtherType value. A field for entering a EtherType	
	value appears.	
• Ethernet Type Value	When "Specific" is selected for the EtherType filter, you can enter a specific	
	EtherType value.	
	The allowed range is 0x600 to 0xFFFF but excluding 0x800(IPv4), 0x806(ARP)	
	and 0x86DD(IPv6). A frame that hits this ACE matches this EtherType value.	

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Cancel: Return to the previous page.

4.5.5.4 ACL Ports Configuration

Configure the ACL parameters (ACE) of each switch port. These parameters will affect frames received on a port unless the frame matches a specific ACE. The ACL Ports Configuration screen in Figure 4-5-5-4 appears.

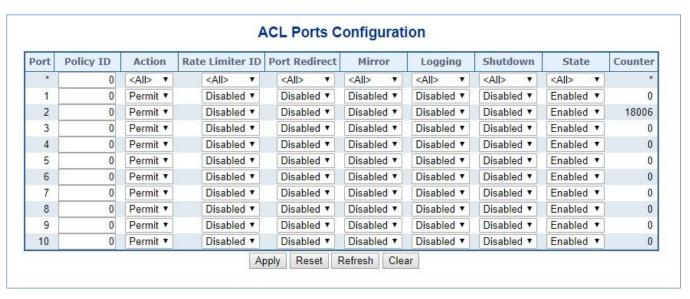

Figure 4-5-5-4: ACL Ports Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Port	The logical port for the settings contained in the same row.
Policy ID	Select the policy to apply to this port. The allowed values are 0 through 255 .
	The default value is 0.
• Action	Select whether forwarding is permitted ("Permit") or denied ("Deny").
	The default value is "Permit".
Rate Limiter ID	Select which rate limiter to apply on this port. The allowed values are Disabled
	or the values 1 through 16.
	The default value is "Disabled".
Port Redirect	Select which port frames are redirected on. The allowed values are Disabled or
	a specific port number and it can't be set when action is permitted. The default
	value is "Disabled".
• Mirror	Specify the mirror operation of this port. The allowed values are:
	Enabled: Frames received on the port are mirrored.
	Disabled: Frames received on the port are not mirrored.
	The default value is "Disabled".
• Logging	Specify the logging operation of this port. The allowed values are:
	■ Enabled : Frames received on the port are stored in the System Log.
	■ Disabled : Frames received on the port are not logged.
	The default value is "Disabled".

	Please note that the System Log memory size and logging rate are limited.	
• Shutdown	Specify the port shut down operation of this port. The allowed values are:	
	■ Enabled: If a frame is received on the port, the port will be disabled.	
	■ Disabled : Port shut down is disabled.	
	The default value is "Disabled".	
• State	Specify the port state of this port. The allowed values are:	
	■ Enabled: To reopen ports by changing the volatile port configuration of the	
	ACL user module.	
	■ Disabled : To close ports by changing the volatile port configuration of the	
	ACL user module.	
	The default value is "Enabled".	
Counter	Counts the number of frames that match this ACE.	

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Refresh: Click to refresh the page; any changes made locally will be undone.

Clear: Click to clear the counters.

4.5.5.5 ACL Rate Limiters

Configure the rate limiter for the ACL of the switch.

The ACL Rate Limiter Configuration screen in Figure 4-5-5-5 appears.

Rate Limiter ID	Rate	Unit
*	10	<all> ▼</all>
1	10	pps ▼
2	10	pps ▼
3	10	pps ▼
4	10	pps ▼
5	10	pps ▼
6	10	pps ▼
7	10	pps ▼
8	10	pps ▼
9	10	pps ▼
10	10	pps ▼
11	10	pps ▼
12	10	pps ▼
13	10	pps ▼
14	10	pps ▼
15	10	pps ▼
16	10	pps ▼

Figure 4-5-5: ACL Rate Limiter Configuration Page Screenshot

The page includes the following fields:

Object	Description
Rate Limiter ID	The rate limiter ID for the settings contained in the same row.
Rate (pps)	The allowed values are: 0-3276700 in pps or 0, 100, 200, 300,, 1000000 in
	kbps.
• Unit	Specify the rate unit. The allowed values are:
	pps: packets per second.
	kbps: Kbits per second.

Buttons

Apply: Click to apply changes

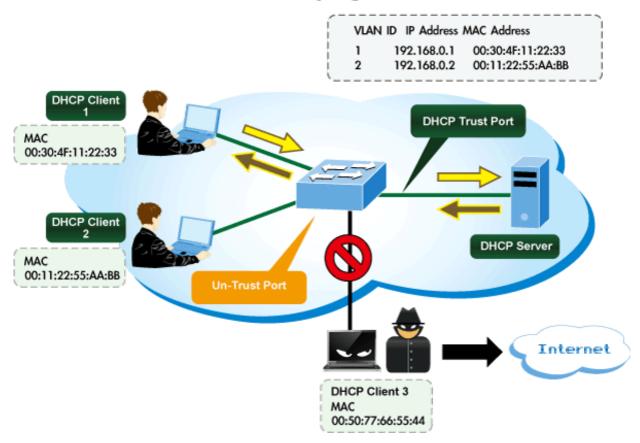

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.6 DHCP Snooping

DHCP Snooping is used to block intruder on the untrusted ports of DUT when it tries to intervene by injecting a bogus DHCP reply packet to a legitimate conversation between the DHCP client and server.

DHCP Snooping Overview

4.5.6.1 DHCP Snooping Configuration

Configure DHCP Snooping on this page. in Figure 4-5-6-1 appears.

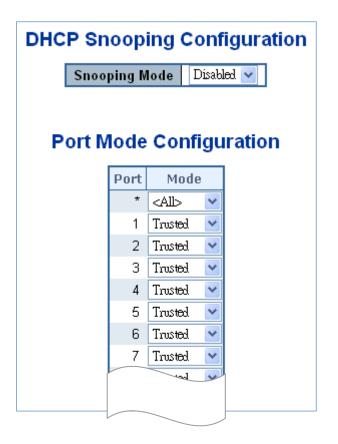

Figure 4-5-6-1: DHCP Snooping Configuration Screen Page Screenshot

The page includes the following fields:

Object	Description
Snooping Mode	Indicates the DHCP snooping mode operation. Possible modes are:
	■ Enabled: Enable DHCP snooping mode operation. When enable DHCP
	snooping mode operation, the request DHCP messages will be forwarded to
	trusted ports and only allowed reply packets from trusted ports.
	■ Disabled : Disable DHCP snooping mode operation.
Port Mode	Indicates the DHCP snooping port mode. Possible port modes are:
Configuration	■ Trusted: Configures the port as trusted sources of the DHCP message.
	■ Untrusted: Configures the port as untrusted sources of the DHCP
	message.

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.6.2 Snooping Table

This page display the dynamic IP assigned information after DHCP Snooping mode is disabled. All DHCP clients obtained the dynamic IP address from the DHCP server will be listed in this table except for local VLAN interface IP addresses. Entries in the Dynamic DHCP snooping Table are shown on this page. The Dynamic DHCP Snooping Table screen in Figure 4-5-6-2 appears.

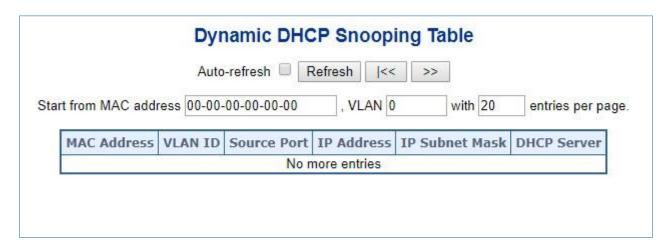

Figure 4-5-6-2: Dynamic DHCP Snooping Table Screen Page Screenshot

Object	Description
MAC Address	User MAC address of the entry.
VLAN ID	VLAN-ID in which the DHCP traffic is permitted.
Source Port	Switch Port Number for which the entries are displayed.
IP Address	User IP address of the entry.
IP Subnet Mask	User IP subnet mask of the entry.
DHCP Server Address	DHCP Server address of the entry.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Refreshes the displayed table starting from the input fields

Clear: Flushes all dynamic entries.

It will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table

Is start over

4.5.7 IP Source Guard

4.5.7.1 IP Source Guard Configuration

IP Source Guard is a secure feature used to restrict IP traffic on **DHCP snooping untrusted ports** by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host. This page provides IP Source Guard related configuration. The IP Source Guard Configuration screen in Figure 4-5-7-1 appears.

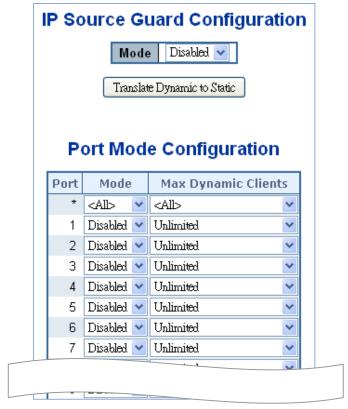

Figure 4-5-7-1: IP Source Guard Configuration Screen Page Screenshot

The page includes the following fields:

Object	Description
Mode of IP Source Guard Configuration	Enable the Global IP Source Guard or disable the Global IP Source Guard. All configured ACEs will be lost when the mode is enabled.
Port Mode Configuration	Specify IP Source Guard is enabled on which ports. Only when both Global Mode and Port Mode on a given port are enabled, IP Source Guard is enabled on this given port.
Max Dynamic Clients	Specify the maximum number of dynamic clients can be learned on given ports. This value can be 0, 1, 2 and unlimited. If the port mode is enabled and the value of max dynamic client is equal 0, it means only allow the IP packets forwarding that are matched in static entries on the specific port.

Buttons

Translate Dynamic to Static : Click to translate all dynamic entries to static entries.

Apply : Click to apply changes

Reset : Click to under any change and leadly and recent to provide the conduction.

: Click to undo any changes made locally and revert to previously saved values.

4.5.7.2 Static IP Source Guard Table

This page provides Static IP Source Guard Table. The Static IP Source Guard Table screen in Figure 4-5-7-2 appears.

Figure 4-5-7-2: Static IP Source Guard Table Screen Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Port	The logical port for the settings.
VLAN ID	The VLAN ID for the settings.
IP Address	Allowed Source IP address.
MAC Address	Allowed Source MAC address.

Buttons

Add New Entry : Click to add a new entry to the Static IP Source Guard table.

: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.7.3 Dynamic IP Source Guard Table

This page provides Static IP Source Guard Table. The Static IP Source Guard Table screen in Figure 4-5-7-3 appears.

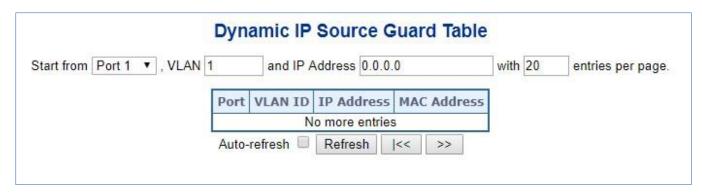

Figure 4-5-7-3: Static IP Source Guard Table Screen Page Screenshot

The page includes the following fields:

Object	Description
• Port	Switch Port Number for which the entries are displayed.
VLAN ID	VLAN-ID in which the IP traffic is permitted.
IP Address	User IP address of the entry.
MAC Address	Source MAC address.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds

Refresh: Refreshes the displayed table starting from the input fields..

Clear: Flushes all dynamic entries.

: Updates the table starting from the first entry in the Dynamic IP Source Guard Table.

! Updates the table, starting with the entry after the last entry currently displayed.

4.5.8 ARP Inspection

4.5.8.1 ARP Inspection

ARP Inspection is a secure feature. Several types of attacks can be launched against a host or devices connected to Layer 2 networks by "poisoning" the ARP caches. This feature is used to block such attacks. Only valid ARP requests and responses can go through DUT. This page provides ARP Inspection related configuration. The ARP Inspection Configuration screen in Figure 4-5-8-1 appears.

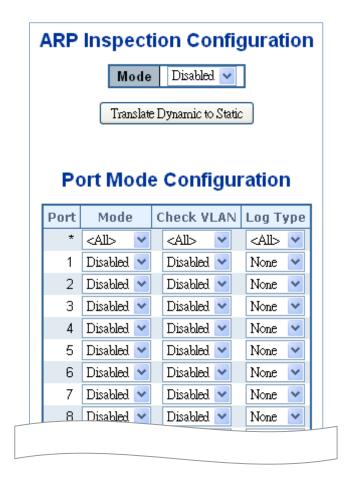

Figure 4-5-8-1: ARP Inspection Configuration Screen Page Screenshot

The page includes the following fields:

Object	Description
Mode of ARP Inspection	Enable the Global ARP Inspection or disable the Global ARP Inspection.
Configuration	
Port Mode Configuration	Specify ARP Inspection is enabled on which ports. Only when both Global
	Mode and Port Mode on a given port are enabled, ARP Inspection is enabled
	on this given port. Possible modes are:
	■ Enabled: Enable ARP Inspection operation.
	■ Disabled : Disable ARP Inspection operation.
	If you want to inspect the VLAN configuration, you have to enable the setting

of "Check VLAN". The default setting of "Check VLAN" is disabled. When the setting of "Check VLAN" is disabled, the log type of ARP Inspection will refer to the port setting. And the setting of "Check VLAN" is enabled, the log type of ARP Inspection will refer to the VLAN setting. Possible setting of "Check

- Enabled: Enable check VLAN operation.
- **Disabled**: Disable check VLAN operation.

Only the Global Mode and Port Mode on a given port are enabled, and the setting of "Check VLAN" is disabled, the log type of ARP Inspection will refer to the port setting. There are four **log types** and possible types are:

- None: Log nothing.
- Deny: Log denied entries.
- **Permit**: Log permitted entries.
- ALL: Log all entries.

Buttons

Translate Dynamic to Static: Click to translate all dynamic entries to static entries.

VLAN" are:

Apply : Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.8.2 ARP Inspection Static Table

This page provides Static ARP Inspection Table. The Static ARP Inspection Table screen in Figure 4-5-8-2 appears.

Figure 4-5-8-2: Static ARP Inspection Table Screen Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Port	The logical port for the settings.
VLAN ID	The VLAN ID for the settings.
MAC Address	Allowed Source MAC address in ARP request packets.
IP Address	Allowed Source IP address in ARP request packets.

Buttons

Add New Entry

: Click to add a new entry to the Static ARP Inspection table.

Apply

: Click to apply changes

Reset

: Click to undo any changes made legally and revert to proviously says

: Click to undo any changes made locally and revert to previously saved values.

4.5.8.3 Dynamic ARP Inspection Table

Entries in the Dynamic ARP Inspection Table are shown on this page. The Dynamic ARP Inspection Table contains up to 1024 entries, and is sorted first by port, then by VLAN ID, then by MAC address, and then by IP address. The Dynamic ARP Inspection Table screen in Figure 5-8-3 appears.

Figure 4-5-8-3: Dynamic ARP Inspection Table Screenshot

Navigating the ARP Inspection Table

Each page shows up to 99 entries from the Dynamic ARP Inspection table, default being 20, selected through the "entries per Page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Dynamic ARP Inspection Table.

The "Start from port address", "VLAN", "MAC address" and "IP address" input fields allow the user to select the starting point in the Dynamic ARP Inspection Table. Clicking the "Refresh" button will update the displayed table starting from that or the closest next Dynamic ARP Inspection Table match. In addition, the two input fields will - upon a "Refresh" button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The ">>" will use the last entry of the currently displayed as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the "|<<" button to start over. The page includes the following fields:

Object	Description	
• Port	The port number for which the status applies. Click the port number to see the	
	status for this particular port.	
VLAN ID	The VLAN ID of the entry.	
MAC Address	The MAC address of the entry.	
IP Address	The IP address of the entry.	

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Refreshes the displayed table starting from the "Start from MAC address" and "VLAN" input fields.

: Flushes all dynamic entries.

: Updates the table starting from the first entry in the MAC Table, i.e. the entry with the lowest VLAN ID and MAC address.

: Updates the table, starting with the entry after the last entry currently displayed.

4.5.9 DHCPv6 Snooping (Only applies to switches installed with firmware after v1.2112bxxxxxx)

Configure DHCPv6 (aka. DHCP over IPv6) Snooping on this page.

Switch Configuration

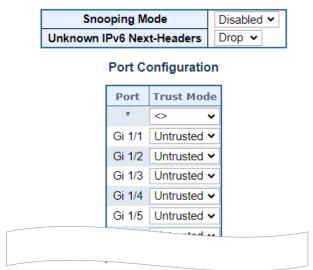

Figure 4-5-9-1: DHCPv6 Snooping Configuration

The configurable items are listed below.

Object	Description
Snooping Mode	Indicates the DHCPv6 snooping mode operation.
	Possible modes are:
	Enabled: Enable DHCPv6 snooping mode operation. When DHCPv6 snooping
	mode operation is enabled, the DHCPv6 client request messages will be
	forwarded to trusted ports and only allow reply packets from trusted ports.
	Disabled: Disable DHCP snooping mode operation.
Unknown IPv6 Next-	Indicates how Unknown IPv6 Next-Header values should be treated. The switch
Headers	needs to parse all IPv6 packets to a DHCPv6 client to determine if it is in fact a
	DHCPv6 message. If an unknown IPv6 extension header is encountered the
	parsing cannot continue. See RFC 7610, section 5, item 3 for details.
	Possible options are:
	Drop: Drop packets with unknown IPv6 extension headers. This is the most
	secure option but may result in traffic disruptions.
	Allow: Allow packets with unknown IPv6 extension headers. This is a less
	secure option but prevents traffic disruptions.
• Port Mode	Indicates the DHCPv6 snooping port mode.
Configuration	Possible port modes are:
	Trusted: Configures the port as trusted source of the DHCPv6 messages.
	Untrusted: Configures the port as untrusted source of the DHCPv6 messages.

4.5.10 IPv6 Source Guard (Only applies to switches installed with firmware after v1.2112bxxxxxx)

4.5.10.1 IPv6 Source Guard Configuration

This page provides IPv6 Source Guard related configuration.

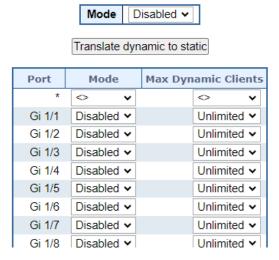

Figure 4-5-10-1: IPv6 Source Guard Configuration

The configurable items are listed as follows.

Object	Description
IPv6 Source Guard	Enable or disable the IPv6 Source Guard globally.
Mode Configuration	
Port Mode	The table shows all ports on the device. There IPv6 Source Guard can be
Configuration	enabled/disabled on individual ports. Only when both Global Mode and Port
	Mode on a given port are enabled, IPv6 Source Guard is enabled on this given
	port.
Max Dynamic Clients	Specify the maximum number of dynamic clients that can be learned on given
	port. This value can be 0, 1, 2 or unlimited. If the port mode is enabled and the
	value of max dynamic client is equal to 0, only IPv6 packets that are matched in
	static entries on the specific port are forwarded.

Control

Disabled : Toggle to change global mode.

Apply : Click to save port changes.

Translate dynamic to static : Click to translate all dynamic entries to static entries.

4.5.10.2 IPv6 Source Guard Static Table

This page shows the static IPv6 Source Guard entries. The maximum number of entries is 112 on the switch.

IPv6 Source Guard Static Table

Auto-refresh Refresh

Port Gi 1/1 VLAN ID IP Address MAC Address Add Entry

Port VLAN ID IPv6 Address MAC Address

Figure 4-5-10-2: IPv6 Source Guard Static Table

The configurable items are listed below.

Object	Description
• Delete	Click entry Delete button to delete the entry.
• Port	The logical port the entry is bound to.
VLAN ID	The VLAN Id for the entry. If no VLAN Id is associated with the entry, this field shows 0.
IPv6 Address	Allowed Source IPv6 address.
Prefix Size	Prefix size of the IPv6 address.
MAC Address	Allowed Source MAC address.

Controls

Gi 1/1 : Toggle to select entry port.

Add Entry: Click to add a new entry to the Static IPv6 Source Guard table.

Auto-refresh: Check this box to refresh the page automatically.

Refresh: Refreshes the display table.

4.5.10.3 IPv6 Source Guard Table

All dynamic entries are shown in the table which can be scrolled up and down when the number of entries exeeds the space allotted for the table.

IPv6 Source Guard Dynamic Table

Auto-refresh Refresh

Port VLAN ID IPv6 Address MAC Address

Figure 4-5-10-3: IPv6 Source Guard Dynamic Table

The descriptions of the items which are shown in the table are listed below.

Object	Description
• Port	Switch Port Number to which the entries are bound.
VLAN ID	VLAN-ID in which the IP traffic is permitted. If no VLAN-ID is associated with the entry, this field shows 0.
IPv6 Address	Source IPv6 address of the entry.
MAC Address	Source MAC address.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Refreshes the display table.

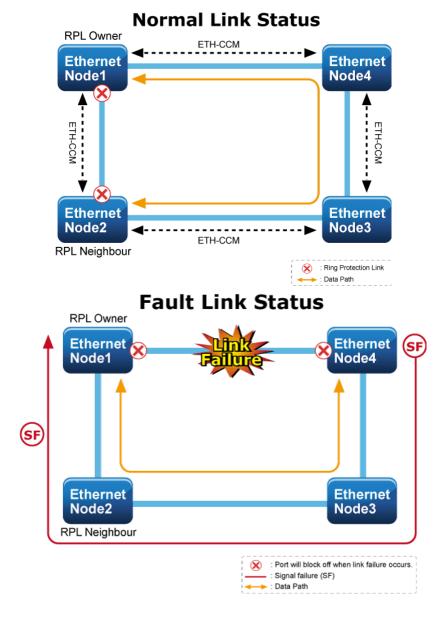

4.6 Ring

4.6.1 Ring

ITU-T G.8032 **Ethernet Ring protection switching (ERPS)** is a link layer protocol applied on Ethernet loop protection to provide sub-50ms protection and recovery switching for Ethernet traffic in a ring topology.

ERPS provides a faster redundant recovery than Spanning Tree topology. The action is similar to STP or RSTP, but the algorithms between them are not the same. In the Ring topology, every switch should be enabled with Ring function and two ports should be assigned as the member ports in the ERPS. Only one switch in the Ring group would be set as the RPL owner switch that one port would be blocked, called **owner port**, and PRL neighbor switch has one port that one port would be blocked, called **neighbor port** that connect to owner port directly and this link is called the **Ring Protection Link** or **RPL**. Each switch will sends ETH-CCM message to check the link status in the ring group. When the failure of network connection occurs, the nodes block the failed link and report the signal failure message, the RPL owner switch will automatically unblocks the PRL to recover from the failure.

4.6.1.1 MEP Configuration

The Maintenance Entity Point instances are configured here; screen in Figure 4-6-1-1 appears.

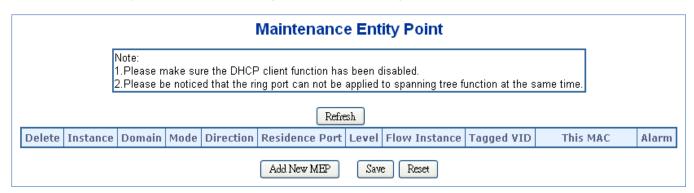

Figure 4-6-1-1: MEP configuration page screenshot

The page includes the following fields:

Object	Description
• Delete	This box is used to mark a MEP for deletion in next Save operation.
• Instance	The ID of the MEP. Click on the ID of a MEP to enter the configuration page.
• Domain	Port: This is a MEP in the Port Domain. 'Flow Instance' is a Port.
	Esp: Future use
	Evc: This is a MEP in the EVC Domain. 'Flow Instance' is a EVC
	Mpls: Future use
• Mode	MEP: This is a Maintenance Entity End Point.
	MIP: This is a Maintenance Entity Intermediate Point.
• Direction	Ingress: This is a Ingress (down) MEP - monitoring ingress traffic on 'Residence Port'.
	Egress: This is a Egress (up) MEP - monitoring egress traffic on 'Residence Port'.
Residence Port	The port where MEP is monitoring - see 'Direction'.
• Level	The MEG level of this MEP.
Flow Instance	The MEP is related to this flow - See 'Domain'.
Tagged VID	Port MEP: An outer C/S-tag (depending on VLAN Port Type) is added with this VID.
	Entering '0' means no TAG added.
This MAC	The MAC of this MEP - can be used by other MEP when unicast is selected (Info only).
• Alarm	There is an active alarm on the MEP.

Buttons

Reset: Click to undo any changes made locally and revert to previously saved values.

4.6.1.2 Detailed MEP Configuration

This page allows the user to inspect and configure the current MEP Instance.; screen in Figure 4-6-1-2 appears.

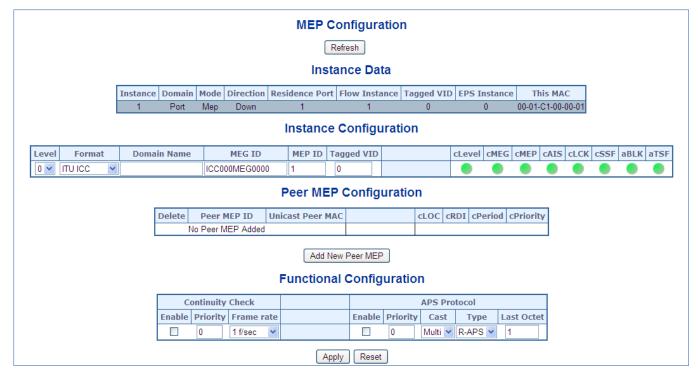

Figure 4-6-1-2: Detail MEP configuration page screenshot

The page includes the following fields:

Instance Data:

Object	Description
• Instance	The ID of the MEP.
• Domain	See help on MEP create WEB.
• Mode	See help on MEP create WEB.
• Direction	See help on MEP create WEB.
Residence Port	See help on MEP create WEB.
Flow Instance	See help on MEP create WEB.
Tagged VID	See help on MEP create WEB.
This MAC	See help on MEP create WEB.

Instance Configuration:

Object	Description
• Level	See help on MEP create WEB.
• Format	This is the configuration of the two possible Maintenance Association Identifier formats.
	ITU ICC: This is defined by ITU. 'ICC' can be max. 6 char. 'MEG id' can be max. 7 char.
	IEEE String: This is defined by IEEE. 'Domain Name' can be max. 8 char. 'MEG id' can
	be max. 8 char.
Domain Name	This is either ITU ICC (MEG ID value[1-6]) or IEEE Maintenance Domain Name -
	depending on 'Format'. See 'Format'.
MEG Id	This is either ITU UMC (MEG ID value[7-13]) or IEEE Short MA Name - depending on
	'Format'. See 'Format'. In case of ITU ICC format this can be max. 7 char. If only 6 char.
	is entered the MEG ID value[13] will become NULL.
MEP Id	This value will become the transmitted two byte CCM MEP ID.
• cLevel	Fault Cause indicating that a CCM is received with a lower level than the configured for
	this MEP.
• cMEG	Fault Cause indicating that a CCM is received with a MEG ID different from configured
	for this MEP.
• cMEP	Fault Cause indicating that a CCM is received with a MEP ID different from all 'Peer
	MEP ID' configured for this MEP.
• cAIS	Fault Cause indicating that AIS PDU is received.
• cLCK	Fault Cause indicating that LCK PDU is received.
• cSSF	Fault Cause indicating that server layer is indicating Signal Fail.
• aBLK	The consequent action of blocking service frames in this flow is active.
• aTSF	The consequent action of indicating Trail Signal Fail to-wards protection is active.
• Delete	This box is used to mark a Peer MEP for deletion in next Save operation.
Peer MEP ID	This value will become an expected MEP ID in a received CCM - see 'cMEP'.
 Unicast Peer 	This MAC will be used when unicast is selected with this peer MEP. Also this MAC is
MAC	used to create HW checking of receiving CCM PDU (LOC detection) from this MEP.
• cLOC	Fault Cause indicating that no CCM has been received (in 3,5 periods) - from this peer
	MEP.
• cRDI	Fault Cause indicating that a CCM is received with Remote Defect Indication - from this
	peer MEP.
• cPeriod	Fault Cause indicating that a CCM is received with a period different what is configured
	for this MEP - from this peer MEP.
• cPriority	Fault Cause indicating that a CCM is received with a priority different what is configured
	for this MEP - from this peer MEP.

Buttons

Add New Peer MEP

: Click to add a new peer MEP.

Functional Configuration

Continuity Check:

Object	Description
• Enable	Continuity Check based on transmitting/receiving CCM PDU can be
	enabled/disabled. The CCM PDU is always transmitted as Multi-cast Class 1.
• Priority	The priority to be inserted as PCP bits in TAG (if any). In case of enable of
	Continuity Check and Loss Measurement both implemented on SW based CCM,
	'Priority' has to be the same.
Frame rate	Selecting the frame rate of CCM PDU. This is the inverse of transmission period
	as described in Y.1731. This value has the following uses:
	* The transmission rate of the CCM PDU.
	* Fault Cause cLOC is declared if no CCM PDU has been received within 3.5
	periods - see 'cLOC'.
	* Fault Cause cPeriod is declared if a CCM PDU has been received with different period - see 'cPeriod'.
	Selecting 300f/sec or 100f/sec will configure HW based CCM (if possible).
	Selecting other frame rates will configure SW based CCM. In case of enable of
	Continuity Check and Loss Measurement both implemented on SW based CCM,
	'Frame Rate' has to be the same.

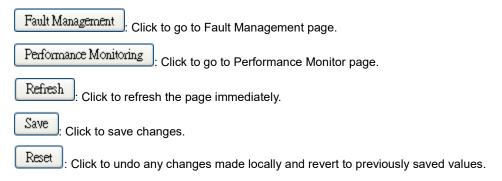

APS Protocol:

Object	Description
• Enable	Automatic Protection Switching protocol information transportation based on
	transmitting/receiving R-APS/L-APS PDU can be enabled/disabled. Must be
	enabled to support ERPS/ELPS implementing APS. This is only valid with one
	Peer MEP configured.
• Priority	The priority to be inserted as PCP bits in TAG (if any).
• Cast	Selection of APS PDU transmitted unicast or multi-cast. The unicast MAC will be
	taken from the 'Unicast Peer MAC' configuration. Unicast is only valid for L-APS
	- see 'Type'. The R-APS PDU is always transmitted with multi-cast MAC
	described in G.8032.

• Type	R-APS: APS PDU is transmitted as R-APS - this is for ERPS.
	L-APS: APS PDU is transmitted as L-APS - this is for ELPS.
Last Octet	This is the last octet of the transmitted and expected RAPS multi-cast MAC. In
	G.8031 (03/2010) a RAPS multi-cast MAC is defined as 01-19-A7-00-00-XX. In
	current standard the value for this last octet is '01' and the usage of other values
	is for further study.

Buttons

4.6.1.3 Ethernet Ring Protocol Switch

The Ethernet Ring Protection Switch instances are configured here; screen in Figure 4-6-1-3 appears.

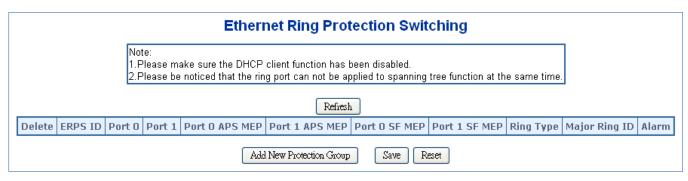

Figure 4-6-1-3: Ethernet Ring Protocol Switch page screenshot

The page includes the following fields:

Object	Description
• Delete	This box is used to mark an ERPS for deletion in next Save operation.
• Port 0	This will create a Port 0 of the switch in the ring.
• Port 1	This will create "Port 1" of the switch in the Ring. As interconnected sub-ring will
	have only one ring port, "Port 1" is configured as "0" for interconnected sub-ring.
	"0" in this field indicates that no "Port 1" is associated with this instance
Port 0 SF MEP	The Port 0 Signal Fail reporting MEP.
Port 1 SF MEP	The Port 1 Signal Fail reporting MEP. As only one SF MEP is associated with
	interconnected sub-ring without virtual channel, it is configured as "0" for such
	ring instances. "0" in this field indicates that no Port 1 SF MEP is associated with
	this instance.
Port 0 APS MEP	The Port 0 APS PDU handling MEP.
Port 1 APS MEP	The Port 1 APS PDU handling MEP. As only one APS MEP is associated with
	interconnected sub-ring without virtual channel, it is configured as "0" for such
	ring instances. "0" in this field indicates that no Port 1 APS MEP is associated
	with this instance.
Ring Type	Type of Protecting ring. It can be either major ring or sub-ring.
Major Ring ID	Major ring group ID for the interconnected sub-ring. It is used to send topology
	change updates on major ring. If ring is major, this value is same as the
	protection group ID of this ring.
• Alarm	There is an active alarm on the ERPS.

Buttons

Add New Protection Group: Click to add a new Protection group entry.

Refresh : Click to refresh the page immediately.

Save : Click to save changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

4.6.1.4 Ethernet Ring Protocol Switch Configuration

This page allows the user to inspect and configure the current ERPS Instance; screen in Figure 4-6-1-4 appears.

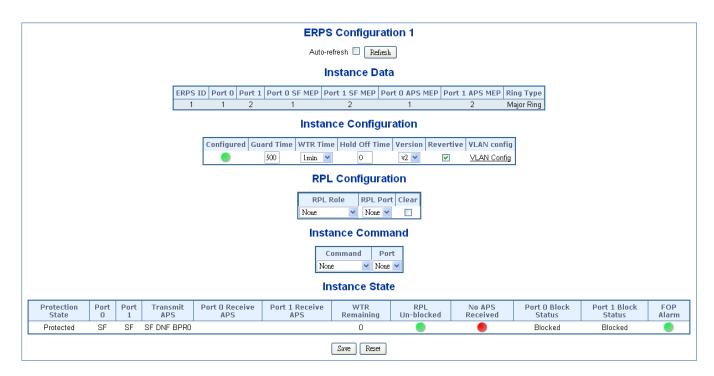

Figure 4-6-1-4: Ethernet Ring Protocol Switch Configuration page screenshot

The page includes the following fields:

Instance Data:

Object	Description
• ERPS ID	The ID of the Protection group.
• Port 0	See help on ERPS create WEB.
• Port 1	See help on ERPS create WEB.
Port 0 SF MEP	See help on ERPS create WEB.
Port 1 SF MEP	See help on ERPS create WEB.
Port 0 APS MEP	See help on ERPS create WEB.
Port 1 APS MEP	See help on ERPS create WEB.
Ring Type	Type of Protecting ring. It can be either major ring or sub-ring.

Instance Configuration:

Object	Description
 Configuration 	Red: This ERPS is only created and has not yet been configured - is not active.
	Green: This ERPS is configured - is active.
• Guard Time	Guard timeout value to be used to prevent ring nodes from receiving outdated
	R-APS messages.
	The period of the guard timer can be configured in 10 ms steps between 10 ms
	and 2 seconds, with a default value of 500 ms
WTR Time	The Wait To Restore timing value to be used in revertive switching.
	The period of the WTR time can be configured by the operator in 1 minute steps
	between 5 and 12 minutes with a default value of 5 minutes.
Hold Off Time	The timing value to be used to make persistent check on Signal Fail before
	switching.
	The range of the hold off timer is 0 to 10 seconds in steps of 100 ms
• Version	ERPS Protocol Version - v1 or v2
Revertive	In Revertive mode, after the conditions causing a protection switch has cleared,
	the traffic channel is restored to the working transport entity, i.e., blocked on the
	RPL.
	In Non-Revertive mode, the traffic channel continues to use the RPL, if it is not
	failed, after a protection switch condition has cleared.
VLAN Config	VLAN configuration of the Protection Group. Click on the "VLAN Config" link to
	configure VLANs for this protection group.

PRL Configuration:

Object	Description
PRL Role	It can be either RPL owner or RPL Neighbor.
PRL Port	This allows to select the east port or west port as the RPL block.
• Clear	If the owner has to be changed, then the clear check box allows to clear the RPL owner for that ERPS ring.

Instance Command:

Object	Description
• Command	Administrative command. A port can be administratively configured to be in
	either manual switch or forced switch state.
• Port	Port selection - Port0 or Port1 of the protection Group on which the command is
	applied.

Instance State:

Object	Description			
Protection State	ERPS state according to State Transition Tables in G.8032.			
• Port 0	OK: State of East port is ok			
	SF: State of East port is Signal Fail			
• Port 1	OK: State of West port is ok			
	SF: State of West port is Signal Fail			
Transmit APS	The transmitted APS according to State Transition Tables in G.8032.			
Port 0 Receive APS	The received APS on Port 0 according to State Transition Tables in G.8032.			
Port 1 Receive APS	The received APS on Port 1 according to State Transition Tables in G.8032.			
WTR Remaining	Remaining WTR timeout in milliseconds.			
RPL Un-blocked	APS is received on the working flow.			
No APS Received	RAPS PDU is not received from the other end.			
Port 0 Block Status	Block status for Port 0 (Both traffic and R-APS block status). R-APS channel is			
	never blocked on sub-rings without virtual channel.			
Port 1 Block Status	Block status for Port 1 (Both traffic and R-APS block status). R-APS channel is			
	never blocked on sub-rings without virtual channel.			
FOP Alarm	Failure of Protocol Defect(FOP) status. If FOP is detected, red LED glows; else			
	green LED glows.

4.6.1.5 Ethernet Ring Protocol Switch

This page allows the user to configure the ERPS by wizard; screen in Figure 4-6-1-5 appears.

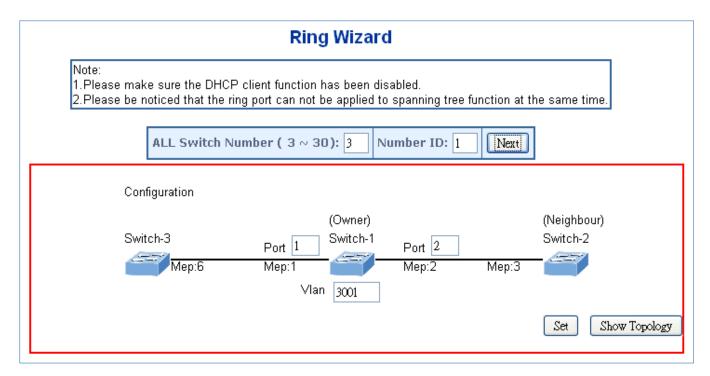

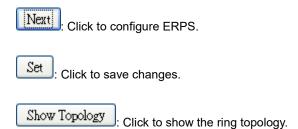

Figure 4-6-1-5: Ring Wizard page screenshot

The page includes the following fields:

Object	Description
All Switch Numbers	Set all the switch numbers for the ring group. The default number is 3 and
	maximum number is 30.
Number ID	The switch where you are requesting ERPS.
• Port	Configures the port number for the MEP.
• VLAN	Set the ERPS VLAN.

Buttons

4.6.1.6 Ring Wizard

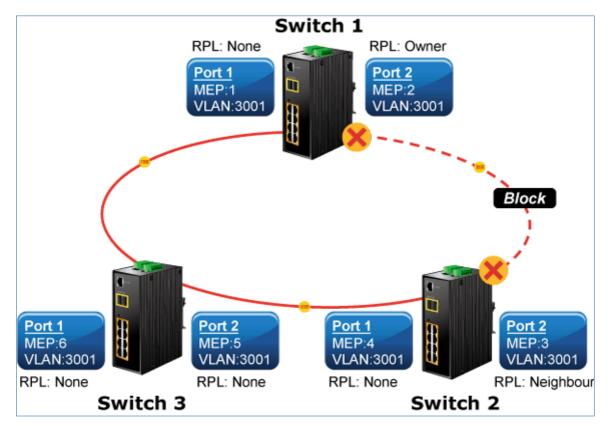

Figure 4-6-1-6: Ring Example Diagram

The above topology often occurs on using ERPS protocol. The multi switch constitutes a single ERPS ring; all of the switches only are configured as an ERPS in VLAN 3001, thereby constituting a single MRPP ring.

Switch ID	Port	MEP ID	RPL Type	VLAN Group
Switch 1	Port 1	1	None	3001
Switch	Port 2	2	Owner	3001
Switch 2	Port 1	4	None	3001
SWILCH 2	Port 2	3	Neighbor	3001
Switch 3	Port 1	6	None	3001
SWILCH S	Port 2	5	None	3001

Table 4-6-1-1: ERPS Configuration Table

The scenario described as follows:

- 1. Disable DHCP client and set proper static IP for Switch 1, 2 & 3. In this example, switch 1 is 192.168.0.101; switch 2 is 192.168.0.102 and switch 3 is 192.168.0.103.
- 2. On switch 1, 2 & 3, disable spanning tree protocol to avoid confliction with ERPS.

Setup steps

Set ERPS Configuration on Switch 1

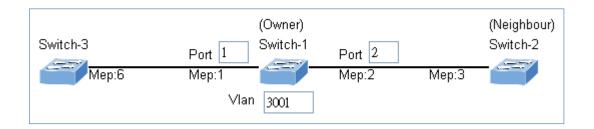

Connect PC to switch 1 directly; don't connect to port 1 & 2

Logging on the Switch 1 and click "Ring > Ring Wizard"

Set "All Switch Number" = 3 and "Number ID" = 1; click "Next" button to set the ERPS configuration for Switch 1.

Set "MEP1" = Port1, "MEP2" = Port2 and VLAN ID = 3001; click "Set" button to save the ERPS configuration for Switch 1.

Set ERPS Configuration on Switch 2

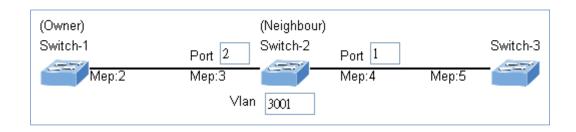

Connect PC to switch 2 directly; don't connect to port 1 & 2

Logging on the Switch 2 and click "Ring > Ring Wizard"

Set "All Switch Number" = 3 and "Number ID" = 2; click "Next" button to set the ERPS configuration for Switch 2.

Set "MEP3" = Port2, "MEP4" = Port1 and VLAN ID = 3001; click "Set" button to save the ERPS configuration for Switch 2.

Set ERPS Configuration on Switch 3

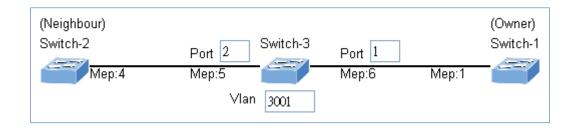

Connect PC to switch 3 directly; don't connect to port 1 & 2

Logging on the Switch 3 and click "Ring > Ring Wizard"

Set "All Switch Number" = 3 and "Number ID" = 3; click "Next" button to set the ERPS configuration for Switch 3.

Set "MEP5" = Port2, "MEP6" = Port1 and VLAN ID = 3001; click "Set" button to save the ERPS configuration for Switch 3.

To avoid loop, please don't connect switch 1, 2 & 3 together in the ring topology before configuring the end of ERPS .

Follow the configuration or ERPS wizard to connect the Switch 1, 2 and 3 together to establish ERPS application:

MEP2 ←→ MEP3 = Switch1 / Port2 ←→ Switch2 / Port2

MEP4 ←→ MEP5 = Switch2 / Port1 ←→ Switch3 / Port2

MEP1 ←→ MEP6 = Switch1 / Port1 ←→ Switch3 / Port1.

Enable

4.6.1.7 ERPS (Only applies to switches installed with firmware after v1.2112bxxxxxx)

ERPS is an abbreviation for Ethernet Ring Protection Switching defined in ITU/T G.8032. It provides fast protection and recovery switching for Ethernet traffic in a ring topology while also ensuring that the Ethernet layer remains loop-free.

Apart from using wizard to set up ERPS ring, this page allows users to set up ERPS ring manually. See Figure 4-6-1-7.

Auto-refresh Refresh RPL | Mode | Port | Type | VC | Instance | Prop | Port | SF | Port |

ERPS Configuration

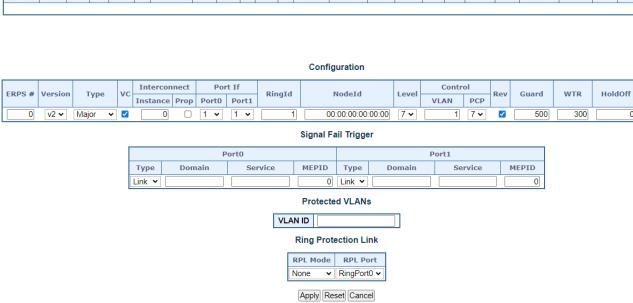

Figure 4-6-1-7: ERPS Ring Manual Configuration

The details for the configurable items are as follows:

Object	Description			
• ERPS#	The ID of ERPS. The allowed value is from 1 - 64.			
• Version	ERPS protocol version. v1 and v2 are supported.			
• Type	Type of ring. Possible values:			
	Major: ERPS major ring (G.8001-2016, clause 3.2.39)			
	Sub: ERPS sub-ring (G.8001-2016, clause 3.2.66)			
	InterSub: ERPS sub-ring on an interconnection node (G.8001-2016, clause			
	3.2.66)			
• VC	Controls whether to use a Virtual Channel with a sub-ring.			
• Interconnect Instance	For a sub-ring on an interconnection node, this must reference the instance ID			
	of the ring to which this sub-ring is connected.			
Interconnect prop	Controls whether the ring referenced by Interconnect Instance shall propagate			
	R-APS flush PDUs whenever this sub-ring's topology changes.			
Ring ID	The Ring ID is used - along with the control VLAN - to identify R-APS PDUs as			
	belonging to a particular ring.			

Node ID	The Node ID is used inside the R-APS specific PDU to uniquely identify this node (switch) on the ring.
• Level	MD/MEG Level of R-APS PDUs we transmit.
Control VLAN	The VLAN on which R-APS PDUs are transmitted and received on the ring ports.
Control PCP	The PCP value used in the VLAN tag of the R-APS PDUs.
• Rev	Revertive (true) or Non-revertive (false) mode.
• Guard	Guard time in ms. Valid range is 10 - 2000 ms.
• WTR	Wait-to-Restore time in seconds. Valid range 1 - 720 sec.
Hold Off	Hold off time in ms. Value is rounded down to 100ms precision. Valid range is 0 - 10000 ms.
• Enable	The administrative state of this ERPS. Check to make it function normally and uncheck to make it cease functioning.

The following explains "Signal Fail Trigger" items:

Object	Description
• Type	Selects whether Signal Fail (SF) comes from the link state of a given interface,
	or from a Down-MEP.
Domain, Service,	Identification of the MEP instance to provide Signal Fail, if Type is MEP.
MEPID	

The "Protected VLANs":

VLANs which are protected by this ring instance. At least one VLAN must be protected. Specify as a comma separated list of vlan numbers or vlan ranges. e.g.: 1,4,7,30-70

Ring Protection Link

Object	Description			
RPL Mode	Ring Protection Link mode. One of			
	None: This switch doesn't have the RPL port in the ring			
	Owner: This switch is RPL owner for the ring (G.8001-2016, clause 3.2.61)			
	Neighbor: This switch is RPL neighbor for the ring (G.8001-2016, clause			
	3.2.60)			
RPL Port	Indicates whether it is port0 or port1 that is the Ring Protection Link. Not used if			
	RPL Mode is None .			

Buttons

Apply: Click to apply changes.

Reset : Click to undo any changes made locally and revert to previously saved values.

Cancel: Return to the previous page; any changes made locally will be undone.

4.6.1.8 ERPS Status (Only applies to switches installed with firmware after v1.2112bxxxxxx)

ERPS Status

Figure 4-6-1-8: ERPS Ring Status

This shows the current status of the ERPS instances.

Object	Description
• ERPS#	The ID of the ERPS. Click on link to get to ERPS detailed instance page, you
	can reset counters and issue commands.
• Oper	The operational state of ERPS instance.
	•: Active.
	Disabled or Internal error.
 Warning 	Operational warnings of ERPS instance.
	: No warnings.
	: There are warnings, use tooltip to see.
• State	Specifies protection/node state of ERPS.
TxRapsActive	Specifies whether we are currently supposed to be transmitting R-APS PDUs on
	our ring ports.
• cFOPTo	Failure of Protocol - R-APS Rx Time Out.
UpdateTimeSecs	Time in seconds since boot that this structure was last updated.
• Request	Request/state according to G.8032, table 10-3.
• Version	Version of received/used R-APS Protocol. 0 means v1, 1 means v2, etc.
• Rb	RB (RPL blocked) bit of R-APS info. See Figure 10-3 of G.8032.
• Dnf	DNF (Do Not Flush) bit of R-APS info. See Figure 10-3 of G.8032."
• Bpr	BPR (Blocked Port Reference) of R-APS info. See Figure 10-3 of G.8032.
Node ID	Node ID of this request.
• SMAC	The Source MAC address used in the request/state.

4.6.2 APS (Only applies to switches installed with firmware after v1.2112bxxxxxx)

G.8031 Ethernet Linear Protection Switching (ELPS) for redundant access links, port failover protection and link modes.

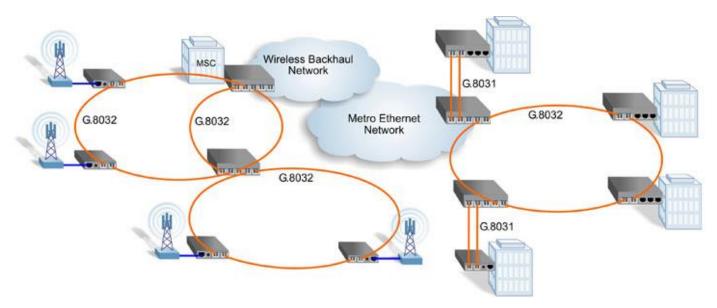

Figure 4-6-1-9: Implimentation Example of G.8031 and G.8032

4.6.2.1 APS Configuration

APS Configuration

APS Signal Fail Trigger

	Working			Protecting					
Port	SF Type	Domain	Service	MEPID	Port	SF Type	Domain	Service	MEPID
1 🕶	Link 🕶			0	1 🕶	Link 🕶			0

Figure 4-6-1-10: APS Configuration

The following shows configurable items of an APS instance:

Object	Description			
• APS#	The ID of the APS. Maximum number of creatable APS instances is 28 . Click on			
	link to get to APS instance page, you can reset counters and issue commands.			
• Port	The Port this flow is attached to.			
SF Trigger	Selects whether Signal Fail (SF) comes from the link state of a given Port, or			
	from a Down-MEP.			
• SF MEP	The Domain::Service::MEPID refers to a MEP instance which shall represent the			
	Working flow. Only used when SF Trigger is MEP. The selected MEP instance			
	does not need to exist when this APS is configured.			
• Mode	1:1 This will create a 1:1 APS.			
	In the linear 1:1 protection switching architecture, the protection transport entity			
	is dedicated to the working transport entity. However, the normal traffic is			
	transported either on the working transport entity or on the protection transport			
	entity using a selector bridge at the source of the protected domain. The selector			
	at the sink of the protected domain selects the entity which carries the normal			
	traffic.			
	1+1 Uni This will create a 1+1 Unidirectional APS.			
	1+1 Bi This will create a 1+1 Bidirectional APS.			
	In the linear 1+1 protection switching architecture, a protection transport entity is			
	dedicated to each working transport entity. The normal traffic is copied and fed			
	to both working and protection transport entities with a permanent bridge at the			
	source of the protected domain. The traffic on working and protection transport			
	entities is transmitted simultaneously to the sink of the protected domain, where			
	a selection between the working and protection transport entities is made based			
	on some predetermined criteria, such as server defect indication.			
• Level	MD/MEG Level (0-7).			
• VLAN	The VLAN ID used in the L-APS PDUs. 0 means untagged.			
• PCP	PCP (priority) (default 7). The PCP value used in the VLAN tag unless the L-			
	APS PDU is untagged. Must be a value in range 0 - 7.			
• SMAC	Source MAC address used in L-APS PDUs. Must be a unicast address. If all-			
	zeros, the switch port's MAC address will be used.			
• Rev	When checked, the port recovery mode is revertive, that is, traffic switches back			
	to the working port after the condition(s) causing a switch has cleared. In the			
	case of clearing a command (e.g. forced switch), this happens immediately. In			
	the case of clearing of a defect, this generally happens after the expiry of the			

	WTR (Wait-To-Restore) timer.
	When unchecked, the port recovery mode is non-revertive and traffic is allowed
	to remain on the protect port after a switch reason has cleared.
• TxAps	Choose whether this end transmits APS PDUs. Only used for 1+1,
170 170	unidirectional.
• WTR	When Rev is checked, WTR (Wait-To-Restore) tells how many seconds to wait
	before restoring to the working port after a fault condition has cleared. Valid
	range 1 - 720
HoldOff	When a new (or more severe) defect occurs, the hold-off timer will be started
	and the event will be reported after the timer expires. HoldOff time is measured
	in milliseconds, and valid values are in the range 0 - 10000. Default is 0, which
	means immediate reporting of the defect.
• Enable	The administrative state of this APS instance. Check to make it function normally
	and uncheck to make it cease functioning.
• Oper	This field can not be configured, but shows the operational state. You can click
	on the link in the APS # field to get more details on the status.
	APS instance is functional.
	APS instance is not functional.
• Warning	If the operational state is Active, the APS instance is indeed active, but it may be
	that it doesn't run as the administrator thinks, because of configuration errors,
	which are reflected in the warnings below.
	The Warning information is indicated by ●: no warning, ●: warning.
	Use the tooltip to get the detailed warning information.

Configuration Buttons

You can modify each APS in the table using the following buttons:

e: Edits the APS row.

8: Deletes the APS.

①: Adds new APS.

Buttons

Refresh : Click to refresh the page.

4.6.2.2 APS Status

APS Status

Auto-refresh Refresh

APS	State		Defect state TxAps			RxAps		Dfop			SMAC	TxCnt	RxCnt						
APS	Operational	Warning	Protection	Working	Protecting	Request	ReSignal	BrSignal	Request	ReSignal	BrSignal	СМ	РМ	NR			TXCIIC	Valid	Invalid
	No entry exists																		

Figure 4-6-1-11: APS Status

This shows the current status of the APS instances.

Object	Description
APS#	The ID of the APS. Maximum number of creatable APS instances is 28 . Click on
	link to get to APS instance page, you can reset counters and issue commands.
State, Operational	The operational state of the APS instance. There are many ways to not have the
	instance active. Each of them has its own value. Only when the state is Active,
	will the APS instance be active and up and running. If the Operational state is
	not "Active", the remaining fields are invalid. The possible values of this field are
	shown below:
	Administratively disabled: Instance is inactive, because it is administratively
	disabled.
	Active: The instance is active and up and running.
	Internal Error: Instance is inactive, because an internal error has occurred.
	Working MEP not Found:Instance is inactive, because the Working MEP is not
	found.
	Protecting MEP not Found: Instance is inactive, because the Protecting MEP
	is not found.
	Working MEP is not administrative active: Instance is inactive, because the
	Working MEP is not admin enabled.
	Protecting MEP is not administrative active: Instance is inactive, because the
	Protecting MEP is not admin enabled.
	Working MEP is not a Down MEP: Instance is inactive, because the Working
	MEP is not a Down-MEP.
	Protecting MEP is not a Down MEP: Instance is inactive, because the
	Protecting MEP is not a Down-MEP.
	Working and Protecting MEP use the same interface: Instance is inactive,
	because both Working and Protecting MEPs use the same I/F.
	Another instance use the same Working port: Instance is inactive, because
	another instance uses the same Working port.
State Warning	If the operational state is Active, the APS instance is indeed active, but it may be
	that it doesn't run as the administrator thinks, because of configuration errors,
	which are reflected in the warnings below.

	The Warning information is indicated by ©: no warning, O: warning.
	Use the tooltip to get the detailed warning information.
State Protection	
State Protection	The possible protection group states. The letters refers to the state as described in G.8031 Annex
	No request Working: A.
	No request Protecting: B.
	Lockout: C.
	Forced Switch: D.
	Signal fail Working: E.
	Signal fail Protecting: F.
	Manual switch to Protecting: G.
	Manual switch to Working: H.
	Wait to restore: I.
	Do not revert: J.
	Exercise Working: K.
	Exercise Protecting: L.
	Reverse request Working: M.
	Reverse request Protecting: N.
	Signal degrade Working: P.
	Signal degrade Protecting: Q.
Defect state, Working	The possible values of this field are shown below:
Protection	ok: The port defect state is OK
	sd: The port defect state is Signal Degrade
	sf: The port defect state is Signal Fail
• TxAps, RxAps -	The possible transmitted or received APS request according to G.8031, Table
Request	11-1.
	nr: No Request.
	dnr: Do Not Revert.
	rr: Reverse Request.
	exer: Exercise.
	wtr: Wait-To-Restore.
	ms: Manual Switch.
	sd: Signal Degrade.
	sfW: Signal Fail for Working.
	fs: Forced Switch.
	sfP: Signal Fail for Protect.
	lo: Lockout.
TxAps, ReSignal	Transmitted requested signal according to G.8031 figure 11-2
TxAps, BrSignal	Transmitted bridged signal according to G.8031 figure 11-2
	Transmitted bridged signal according to 0.0031 figure 11-2

RxAps, BrSignal	Received bridged signal according to G.8031 figure 11-2
• Dfop	Dfop is "Failure of Protocol defect" and the presence of a defect is indicated
	by ●: no defect, ●: defect.
	CM: Configuration Mismatch (received APS PDU on working interface within last
	17.5 seconds).
	PM: Provisioning Mismatch (far and near ends are not using the same mode;
	bidir only)
	NR: No Response (far end hasn't agreed on 'Requested Signal' within 50 ms;
	bidir only)
	TO: Time Out (near end hasn't received a valid APS PDU within last 17.5
	seconds; bidir only)
• SMAC	Source MAC address of last received APS PDU or all-zeros if no PDU has been
	received.
• TxCnt	Number of APS PDU frames transmitted.
RxCnt, Valid	Number of valid APS PDU frames received on the protect port.
RxCnt, Invalid	Number of invalid APS PDU frames received on the protect port.

Buttons

Refresh : Click to refresh the page.

4.7 Maintenance

4.7.1 Switch Maintenance

This chapter is teaching how to upgrade the firmware, how to save the switch running configure and how to download/upload the configure file and etc.

4.7.1.1 Web Firmware Upgrade

This page facilitates an update of the firmware controlling the switch. The Web Firmware Upgrade screen in Figure 4-7-1-1 appears.

Figure 4-7-1-1: Web Firmware Upgrade Page Screenshot

To open Firmware Upgrade screen, perform the following:

- 1. Click Maintenance -> Web Firmware Upgrade.
- 2. The Firmware Upgrade screen is displayed as in Figure 4-7-1-1
- 3. Click the "Choose File "button of the Main page; the system would pop up the file selection menu to choose firmware.
- 4. Select on the firmware and then click "Upload". The **Software Upload Progress** would show the file with upload status.
- Once the software is loaded to the system successfully, the following screen appears. The system will load the new software after reboot.

Figure 4-7-1-2: Software Successfully Loaded Notice Screen

DO NOT Power OFF the **Industrial Managed Switch** until the update progress is complete.

Do not quit the Firmware Upgrade page without pressing the "**OK**" button after the image is loaded. Or the system won't apply the new firmware. User has to repeat the firmware upgrade processes.

4.7.1.2 Save Startup Config

This function allows to save the current configuration, thereby ensuring that the current active configuration can be used at the next reboot as the screen in Figure 4-7-1-3 appears. After saving the configuration, the screen in Figure 4-7-1-4 will appear.

Figure 4-7-1-3: Configuration Save Page Screenshot

Figure 4-7-1-4: Finish Saving Page Screenshot

4.7.1.3 Configuration Download

The switch stores its configuration in a number of text files in CLI format. The files are either virtual (RAM-based) or stored in flash on the switch.

There are three system files:

- running-config: A virtual file that represents the currently active configuration on the switch. This file is volatile.
- startup-config: The startup configuration for the switch, read at boot time.
- default-config: A read-only file with vendor-specific configuration. This file is read when the system is restored to default settings.

It is also possible to store up to two other files and apply them to running-config, thereby switching configuration.

Configuration Download page allows the download the running-config, startup-config and default-config on the switch. Please refer to the Figure 4-7-1-5 shown below.

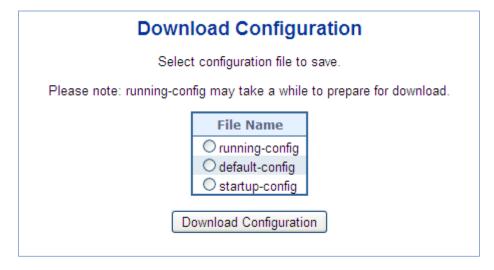

Figure 4-7-1-5: Configuration Download Page Screenshot

4.7.1.4 Configuration Upload

Configuration Upload page allows the upload the running-config and startup-config on the switch. Please refer to the Figure 4-7-1-6 shown below.

Figure 4-7-1-6: Configuration Upload Page Screenshot

If the destination is running-config, the file will be applied to the switch configuration. This can be done in two ways:

- Replace mode: The current configuration is fully replaced with the configuration in the uploaded file.
- Merge mode: The uploaded file is merged into running-config.

If the file system is full (i.e. contains the three system files mentioned above plus two other files), it is not possible to create new files, but an existing file must be overwritten or another deleted first.

4.7.1.5 Configuration Activate

Thje Configure Activate page allows to activate the startup-config and default-config files present on the switch. Please refer to the Figure 4-7-1-7 shown below.

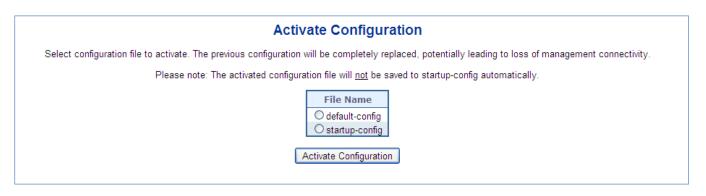

Figure 4-7-1-7: Configuration Activate Page Screenshot

It is possible to activate any of the configuration files present on the switch, except for *running-config* which represents the currently active configuration.

Select the file to activate and click Activate Configuration. This will initiate the process of completely replacing the existing configuration with that of the selected file.

4.7.1.6 Configuration Delete

The Configure Delete page allows to delete the startup-config and default-config files which are stored in FLASH. If this is done and the switch is rebooted without a prior Save operation, this effectively resets the switch to default configuration. Please refer to the Figure 4-7-1-8 shown below.

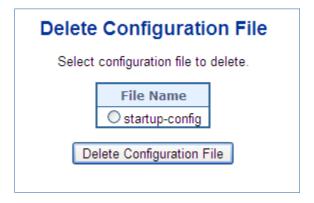

Figure 4-7-1-8: Configuration Delete Page Screenshot

4.7.1.7 Image Select

This page provides information about the active and alternate (backup) firmware images in the device, and allows you to revert to the alternate image. The web page displays two tables with information about the active and alternate firmware images. The Image Select screen in Figure 4-7-1-9 appears.

In case the active firmware image is the alternate image, only the "Active Image" table is shown. In this case, the Activate Alternate Image button is also disabled.

- If the alternate image is active (due to a corruption of the primary image or by manual intervention), uploading a new firmware image to the device will automatically use the primary image slot and activate this.
- 2. The firmware version and date information may be empty for older firmware releases. This does not constitute an error.

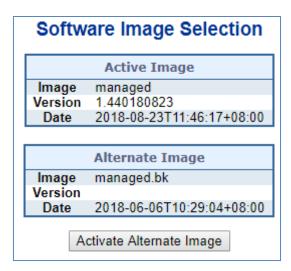

Figure 4-7-1-9: Software Image Selection Page Screenshot

The page includes the following fields:

Object	Description
• Image	The flash index name of the firmware image. The name of primary (preferred) image is image, the alternate image is named image.bk.
• Version	The version of the firmware image.
• Date	The date when the firmware was produced.

Buttons

Activate Alternate Image: Click to use the alternate image. This button may be disabled depending on system state.

4.7.1.8 Factory Default

You can reset the configuration of the **Industrial Managed Switch** on this page. Only the IP configuration is retained. The new configuration is available immediately, which means that no restart is necessary. The Factory Default screen in Figure 4-7-1-10 appears.

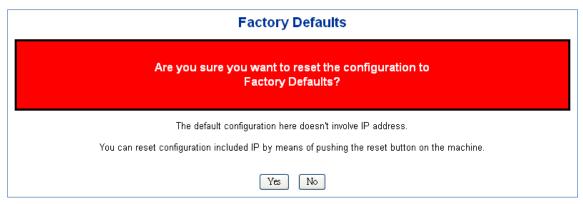

Figure 4-7-1-10: Factory Default Page Screenshot

Buttons

<u>Yes</u>: Click to reset the configuration to Factory Defaults.

: Click to return to the Port State page without resetting the configuration.

To reset the **Industrial Managed Switch** to the Factory default setting, you can also press the hardware reset button at the front panel about 10 seconds. After the device is rebooted, you can login the management Web interface within the same subnet of 192.168.0.xx.

4.7.1.9 System Reboot

The **Reboot** page enables the device to be rebooted from a remote location. Once the Reboot button is pressed, user has to re-login the Web interface about 60 seconds later; the System Reboot screen in Figure 4-7-1-11 appears.

Figure 4-7-1-11: System Reboot Page Screenshot

Buttons

Yes: Click to reboot the system.

No: Click to return to the Port State page without rebooting the system.

You can also check the **SYS LED** on the front panel to identify whether the System is loaded completely or not. If the SYS LED is blinking, then it is in the firmware load stage; if the SYS LED light is on, you can use the Web browser to login the **Industrial Managed Switch**.

4.7.2 Diagnostics

This section provide the Physical layer and IP layer network diagnostics tools for troubleshoot. The diagnostic tools are designed for network manager to help them quickly diagnose problems between point to point and better service customers.

Use the Diagnostics menu items to display and configure basic administrative details of the Industrial Managed Switch. Under System the following topics are provided to configure and view the system information:

This section has the following items:

- Ping
- IPv6 Ping
- Remote IP Ping
- Cable Diagnostics

Ping

The ping and IPv6 ping allow you to issue ICMP PING packets to troubleshoot IP connectivity issues. The Industrial Managed Switch transmit ICMP packets, and the sequence number and roundtrip time are displayed upon reception of a reply.

Cable Diagnostics

The Cable Diagnostics performing tests on copper cables. These functions have the ability to identify the cable length and operating conditions, and to isolate a variety of common faults that can occur on the Cat5 twisted-pair cabling. There might be two statuses as follow:

- If the link is established on the twisted-pair interface in 1000BASE-T mode, the Cable Diagnostics can run without disruption of the link or of any data transfer.
- If the link is established in 100BASE-TX or 10BASE-T, the Cable Diagnostics cause the link to drop while the diagnostics are running.

After the diagnostics are finished, the link is reestablished. And the following functions are available.

- Coupling between cable pairs.
- Cable pair termination
- Cable Length

4.7.2.1 Ping

This page allows you to issue ICMP PING packets to troubleshoot IP connectivity issues.

After you press "**Start**", 5 ICMP packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMP Ping screen in Figure 4-7-2-1 appears.

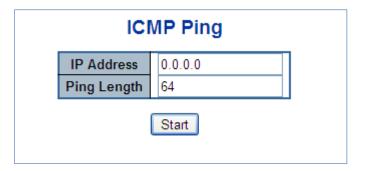

Figure 4-7-2-1: ICMP Ping Page Screenshot

The page includes the following fields:

Object	Description
IP Address	The destination IP Address.
Ping Length	The payload size of the ICMP packet. Values range from 2 bytes to 1452 bytes.

Be sure the target IP Address is within the same network subnet of the **Industrial Managed Switch**, or you had setup the correct gateway IP address.

Buttons

Start: Click to transmit ICMP packets.

New Ping : Click to re-start diagnostics with PING.

4.7.2.2 IPv6 Ping

This page allows you to issue ICMPv6 PING packets to troubleshoot IPv6 connectivity issues.

After you press "**Start**", 5 ICMPv6 packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMPv6 Ping screen in Figure 4-7-2-2 appears.

Figure 4-7-2-2: ICMPv6 Ping Page Screenshot

The page includes the following fields:

Object	Description
IP Address	The destination IP Address.
Ping Length	The payload size of the ICMP packet. Values range from 2 bytes to 1452 bytes.

Buttons

Start : Click to transmit ICMP packets.

New Ping : Click to re-start diagnostics with PING.

4.7.2.3 Remote IP Ping Test

This page allows you to issue ICMP PING packets to troubleshoot IP connectivity issues on special port.

After you press "**Test**", 5 ICMP packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMP Ping screen in Figure 4-7-2-3 appears.

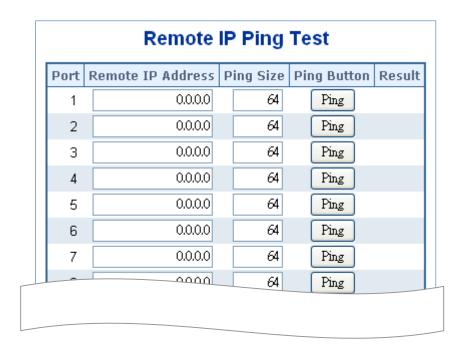

Figure 4-7-2-3: Remote IP Ping Test Page Screenshot

The page includes the following fields:

Object	Description
• Port	The logical port for the settings.
Remote IP Address	The destination IP Address.
Ping Size	The payload size of the ICMP packet. Values range from 8 bytes to 1400 bytes.
Result	Display the ping result.

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

: Clears the IP Address and the result of ping value.

4.7.2.4 Cable Diagnostics

This page is used for running the Cable Diagnostics.

Press to run the diagnostics. This will take approximately 5 seconds. If all ports are selected, this can take approximately 15 seconds. When completed, the page refreshes automatically, and you can view the cable diagnostics results in the cable status table. Note that Cable Diagnostics is only accurate for cables of length 7 - 140 meters.

10 and 100 Mbps ports will be linked down while running cable diagnostic. Therefore, running cable diagnostic on a 10 or 100 Mbps management port will cause the switch to stop responding until VeriPHY is complete. The VeriPHY Cable Diagnostics screen in Figure 4-7-2-4 appears.

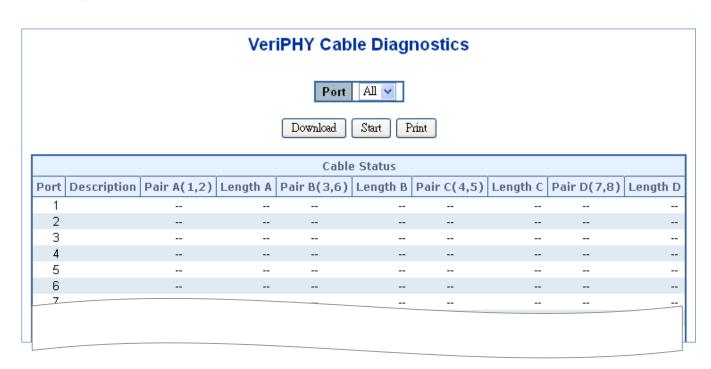

Figure 4-7-2-4 VeriPHY Cable Diagnostics Page Screenshot

The page includes the following fields:

Object	Description
• Port	The port where you are requesting Cable Diagnostics.
• Description	Display per port description.
Cable Status	Port:
	Port number.
	Pair:
	The status of the cable pair.
	OK - Correctly terminated pair
	Open - Open pair

Short - Shorted pair

Short A - Cross-pair short to pair A

Short B - Cross-pair short to pair B

Short C - Cross-pair short to pair C

Short D - Cross-pair short to pair D

Cross A - Abnormal cross-pair coupling with pair A

Cross B - Abnormal cross-pair coupling with pair B

Cross C - Abnormal cross-pair coupling with pair C

Cross~D - Abnormal cross-pair coupling with pair D

Length:

The length (in meters) of the cable pair. The resolution is 3 meters

Buttons

Start : Click to run the diagnostics.

4.7.2.5 Traceroute IPv4 (Only applies to switches installed with firmware after v1.2112bxxxxxx)

This page allows you to perform a **traceroute** test over IPv4 towards a remote host. **traceroute** is a diagnostic tool for displaying the route and measuring transit delays of packets across an IPv4 network.

Traceroute (IPv4)

Fill in the parameters as needed and press "Start" to initiate the Traceroute session.

Hostname or IP Address	
DSCP Value	0
Number of Probes Per Hop (packets)	3
Response Timeout (seconds)	3
First TTL Value	1
Max TTL Value	30
VID for Source Interface	
IP Address for Source Interface	
Use ICMP instead of UDP	
Print Numeric Addresses	

Start

Figure 4-7-2-5: IPv4 Traceroute

You can configure the following parameters for the test.

Object	Description
Hostname	The destination IP Address.
DSCP Value	This value is used for the DSCP value in the IPv4 header. The default value is 0. The
	valid range is 0-63.
Number of	Determines the number of probes (packets) sent for each hop. The default value is 3.
Probes Per Hop	The valid range is 1-60.
• Response	Determines the number of seconds to wait for a reply to a sent request. The default
Timeout	number is 3. The valid range is 1-86400.
First TTL Value	Determines the value of the Time-To-Live (TTL) field in the IPv4 header in the first
	packet sent. The default number is 1. The valid range is 1-30.
Max TTL Value	Determines the maximum value of the Time-To-Live (TTL) field in the IPv4 header. If
	this value is reached before the specified remote host is reached the test stops. The
	default number is 30. The valid range is 1-255.
VID for Source	This field can be used to force the test to use a specific local VLAN interface as the
Interface	source interface. Leave this field empty for automatic selection based on routing
	configuration.
	Note: You may only specify either the VID or the IP Address for the source interface.
 Address for 	This field can be used to force the test to use a specific local interface with the
Source Interface	specified IP address as the source interface. The specified IP address must be
	configured on a local interface. Leave this field empty for automatic selection based
	on routing configuration.

	Note: You may only specify either the VID or the IP Address for the source interface.
Use ICMP instead	By default the traceroute command will use UDP datagrams. Selecting this option
of UDP	forces it to use ICMP ECHO packets instead.
Print Numeric	By default the traceroute command will print out hop information using a reverse DNS
Addresses	lookup for the acquired host ip addresses. This may slow down the display if the DNS
	information is not available. Selecting this option will prevent the reverse DNS lookup
	and force the traceroute command to print numeric IP addresses instead.

4.7.2.6 Traceroute IPv6 (Only applies to switches installed with firmware after v1.2112bxxxxxx)

This page allows you to perform a **traceroute** test over IPv6 towards a remote host. **traceroute** is a diagnostic tool for displaying the route and measuring transit delays of packets across an IPv6 network.

You can configure the following parameters for the test.

Object	Description
Hostname or IP	The destination IP Address.
Address	
DSCP Value	This value is used for the DSCP value in the IPv4 header. The default value is 0. The
	valid range is 0-63.
Number of	Determines the number of probes (packets) sent for each hop. The default value is 3.
Probes Per Hop	The valid range is 1-60.
• Response	Determines the number of seconds to wait for a reply to a sent request. The default
Timeout	number is 3. The valid range is 1-86400.
Max TTL Value	Determines the maximum value of the Time-To-Live (TTL) field in the IPv4 header. If
	this value is reached before the specified remote host is reached the test stops. The
	default number is 30. The valid range is 1-255.
VID for Source	This field can be used to force the test to use a specific local VLAN interface as the
Interface	source interface. Leave this field empty for automatic selection based on routing
	configuration.
	Note: You may only specify either the VID or the IP Address for the source interface.
 Address for 	This field can be used to force the test to use a specific local interface with the specified
Source	IP address as the source interface. The specified IP address must be configured on a
Interface	local interface. Leave this field empty for automatic selection based on routing
	configuration.
	Note: You may only specify either the VID or the IP Address for the source interface.
• Print Numeric	By default the traceroute command will print out hop information using a reverse DNS
Addresses	lookup for the acquired host ip addresses. This may slow down the display if the DNS
	information is not available. Selecting this option will prevent the reverse DNS lookup
	and force the traceroute command to print numeric IP addresses instead.

4.8 Power over Ethernet

4.8.1 PoE

The IGS-6325-24P4X, IGS-6325-24P4S, and IGS-6325-24UP4X PoE Switches provide up to 24 PoE in-line power interfaces, making them ideal for building a power centrally controlled IP phone system, IP camera system, or AP group for your enterprise. For example, you can easily install 24 cameras or APs around the corners of your company for surveillance or create a wireless roaming environment in your office. Without the limitation of power sockets, these switches make installing cameras or WLAN APs easier and more efficient.

The new IGS-6325-24UP4X model supports 24-port PoE++ and has a total PoE budget of 1440W, allowing it to power up to 24 IEEE802.3bt Type-3 devices that require 60W simultaneously.

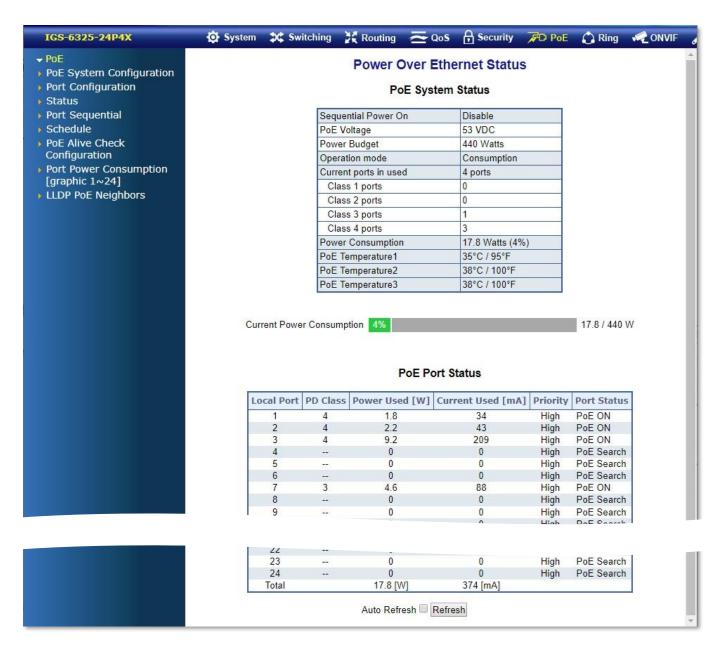

Figure 4-8-1-1: Power over Ethernet Status

4.8.1.1 Power over Ethernet Powered Device

	Voice over IP phones
6	Enterprises can install PoE VoIP phones, ATA sand other Ethernet/non-
	Ethernet end-devices in the center where UPS is installed for un-
3~5 watts	interruptible power system and power control system.
	Wireless LAN Access Points Access points can be installed at museums, sightseeing sites, airports,
6~12 watts	hotels, campuses, factories, warehouses, etc.
	IP Surveillance
	IP cameras can be installed at enterprises, museums, campuses, hospitals,
10~12 watts	banks, etc. without worrying about electrical outlets.
100	PoE Splitter
	PoE Splitter split the PoE 56V DC over the Ethernet cable into 5/12V DC
	power output. It frees the device deployment from restrictions due to power
3~12 watts	outlet locations, which eliminate the costs for additional AC wiring and
	reduces the installation time.
	High Power PoE Splitter
(Rose)	High PoE Splitter split the PoE 56V DC over the Ethernet cable into 24/12V
	DC power output. It frees the device deployment from restrictions due to
3~25 watts	power outlet locations, which eliminate the costs for additional AC wiring and
3~25 watts	reduces the installation time.
	High Power Speed Dome state-of-the-art design fits in various network environments like traffic centers, shopping malls, railway stations, warehouses, airports and
2	production facilities for the most demanding outdoor surveillance
30~90 watts	applications. No electricians are needed to install AC sockets.

4.8.1.2 System Configuration

In a power over Ethernet system, operating power is applied from a power source (PSU or -power supply unit) over the LAN infrastructure to **powered devices (PDs)**, which are connected to ports. Under some conditions, the total output power required by PDs can exceed the maximum available power provided by the PSU. The system may come with a PSU capable of supplying less power than the total potential power consumption of all the PoE ports in the system. In order to maintain the activity of the majority of ports, power management is implemented.

The PSU input power consumption is monitored by measuring voltage and current . The input power consumption is equal to the system's aggregated power consumption . The power management concept allows all ports to be active and activates additional ports, as long as the aggregated power of the system is lower than the power level at which additional PDs cannot be connected . When this value is exceeded, ports will be deactivated, according to user-defined priorities. The power budget is managed according to the following user-definable parameters: maximum available power, ports priority, maximum allowable power per port.

Reserved Power determined by

There are five modes for configuring how the ports/PDs may reserve power and when to shut down ports.

Consumption mode

In Consumption mode, each port automatically determines how much power to reserve based on the class of the connected powered device (PD). Four power classes are available: 4W, 7W, 15.4W, 30.8W, and 60W. (Note that a single port of the IGS-6325-24UP4X can support up to 95W PoE output.)

Class	Usage	Range of maximum power used by the PD	Class Description
0	Default	0.44 to 12.95 watts	Classification unimplement
1	Optional	0.44 to 3.84 watts	Very low power
2	Optional	3.84 to 6.49 watts	Low power
3	Optional	6.49 to 12.95 watts (or to 15.4 watts)	Mid power
4	Optional	12.95 to 60 watts (or to 72 watts)	High power

Allocation mode

In this mode the user allocates the amount of power that each port may reserve. The allocated/reserved power for each port/PD is specified in the Maximum Power fields. The ports are shut down when total reserved powered exceeds the amount of power that the power supply can deliver.

In this mode the port power will not be turned on if the PD requests more available power.

■ LLDP mode

In this mode the ports of PoE power are managed and determined by LLDP Media Protocol.

4.8.1.3 Power over Ethernet Configuration

This section allows the user to inspect and configure the current PoE configuration settings, as Figure 4-8-1-2 appears.

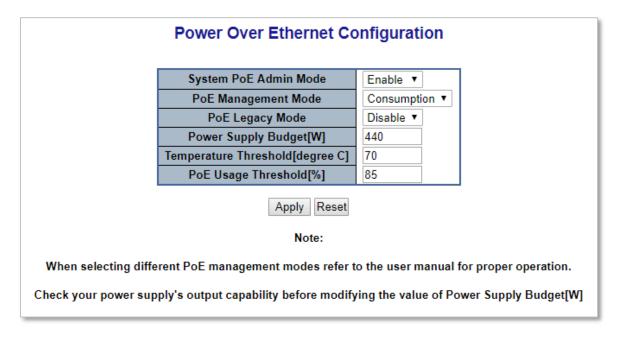

Figure 4-8-1-2: PoE Configuration Screenshot

The page includes the following fields:

	<u> </u>	
Object	Description	
System PoE Admin	Allows user to enable or disable PoE function. It will causes all of PoE ports to	
Mode	supply or not supply power.	
PoE Temperature	Allows user to enable or disable PoE Temperature Protection.	
Protection		
PoE Management	There are Six modes for configuring how the ports/PDs may reserve power and	
Mode	when to shut down ports.	
	■ Class-Consumption mode: System offers PoE power according to PD real	
	power consumption.	
	■ Class-Reserved-Power mode: System reserves PoE power to PD	
	according to PoE class level.	
	■ Allocation-Consumption mode: System offers PoE power according to	
	PD real power consumption.	
	■ Allocation-Reserved-Power mode: Users are allowed to assign how much	
	PoE power for each port and system will reserve PoE power to PD.	
	■ LLDP-Consumption mode: System offers PoE power according to PD real	
	power consumption.	
	■ LLDP-Reserved-Power mode: System reserves PoE power to PD	
	according to LLDP configuration.	

PoE Legacy Mode	A port is powered using high-inrush current, which is used by legacy PDs with a
	power .
Power Supply Budget	Set limit value of the total PoE port providing power to the PDs.
[W]	
Temperature	Allows setting over temperature protection threshold value. If Its system
Threshold	temperature is over the threshold then system will lower total PoE power
	budget automatically.
PoE Usage Threshold	Allows setting how much PoE power budget could be limited.

Buttons

Apply : Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

The wire gauge for the terminal block should be in the range of $12 \sim 22 \text{ AWG} @ 25 \text{ degrees C}$.

PD Classifications

A PD may be classified by the PSE based on the classification information provided by the PD. The intent of PD classification is to provide information about the maximum power required by the PD during operation. However, to improve power management at the PSE, the PD provides a signature about **Class level**.

The PD is classified based on power. The classification of the PD is the maximum power that the PD will draw across all input voltages and operational modes.

A PD will return to Class 0 to 4 in accordance with the maximum power draw as specified by Table 4-8-1-1.

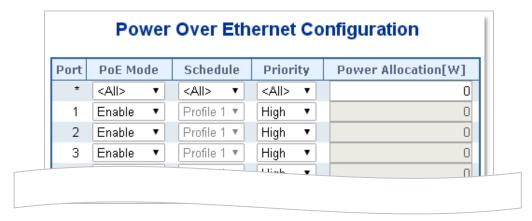

Class	Usage	Range of maximum power used by the PD	Class Description
0	Default	0.44 to 12.95 watts	Classification unimplement
1	Optional	0.44 to 3.84 watts	Very low power
2	Optional	3.84 to 6.49 watts	Low power
3	Optional	6.49 to 12.95 watts (or to 15.4 watts)	Mid power
4	Optional	12.95 to 60 watts (or to 72 watts)	High power

Table 4-8-1-1 Device Class.

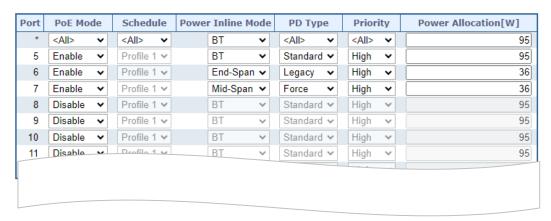

4.8.1.4 Port Configuration

This section allows the user to inspect and configure the current PoE port settings as Figure 4-8-1-3 shows.

PoE Configuration of IGS-6325-24P4X & IGS-6325-24P4S

Power Over Ethernet Configuration

PoE Configuration of IGS-6325-24UP4X

Figure 4-8-1-3: Power over Ethernet Configuration Screenshot

The page includes the following fields:

Object	Description	
PoE Mode	There are three modes for PoE mode.	
	■ Enable: enable PoE function.	
	■ Disable : disable PoE function.	
	■ Schedule: enable PoE function in schedule mode.	
• Schedule	Indicates the scheduled profile mode. Possible profiles are:	
	■ Profile1	
	■ Profile2	
	■ Profile3	
	■ Profile4	

Power Inline Mode	Allows user to select IEEE802.3af/802.3at/802.3bt/Ultra PoE compatibility mode.
	The default value is 802.3bt mode.
	Indicates the power inline mode. Possible profiles are:
	■ BT: Pins 1–2 (pair #2 in both T568A and T568B) form one side of the DC supply and pins 3–6 (pair #3 in both T568A and T568B) provide the return. Pins 4–5 (pair #1 in both T568A and T568B) form one side of the DC supply and pins 7–8 (pair #4 in both T568A and T568B) provide the return ■ End-Span: Pins 1–2 (pair #2 in both T568A and T568B) form one
	side of the DC supply and pins 3–6 (pair #3 in both T568A and T568B) provide the return
	■ Mid-Span: Pins 4–5 (pair #1 in both T568A and T568B) form one side of the DC supply and pins 7–8 (pair #4 in both T568A and T568B) provide the return
• PD Type	Provide Standard/Legacy/Force options for PD type; the default mode is
	standard mode. The available options are:
	 Standard: This mode is IEEE 802.3bt PoE++ Type-4 or Type-3 PSE. Pins 1-2 (pair #2 in both T568A and T568B) form one side of the DC supply and pins 3-6 (pair #3 in both T568A and T568B) provide the return. Pins 4-5 (pair #1 in both T568A and T568B) form one side of the DC supply and pins 7-8 (pair #4 in both T568A and T568B) provide the return. Maximum power is 95 watts. Legacy: In the legacy mode, the IEEE method will be tried first and if it fails to discover a valid PD, the legacy capacitance measurement with a large capacitance value will be used to detect a legacy PD. This mode is used to support legacy devices. Force: The force power function will directly deliver power over UTP cable. Please be careful when using force power function and make sure the remote device is PoE powered device (PD).
Extended Mode	Provide to disable or enable PoE extended mode.
• Priority	The Priority represents PoE ports priority. There are three levels of power priority named Low , High and Critical . The priority is used in case the total power consumption is over the total power.
	The priority is used in case the total power consumption is over the total power budget. In this case the port with the lowest priority will be turned off, and offer power for the port of higher priority.
• PD Class	Displays the class of the PD attached to the port, as established by the classification process. Class 0 is the default for PDs. The PD is powered based on PoE Class level if the system is working in Classification mode.

Current Used [mA]	The Power Used shows how much current the PD currently is using.
Power Used [W]	The Power Used shows how much power the PD currently is using.
Power Allocation [W]	It can limit the port PoE supply watts. Per port maximum value must be 95
	watts. Total port values must be less than the Power Reservation value. Once
	power overload is detected, the port will auto shut down and keep in detection
	mode until PD's power consumption is lower than the power limit value.

Buttons

Apply : Click to apply changes.

4.8.1.5 PoE Status

This page allows the user to inspect the total power consumption, total power reserved and current status for all PoE ports.

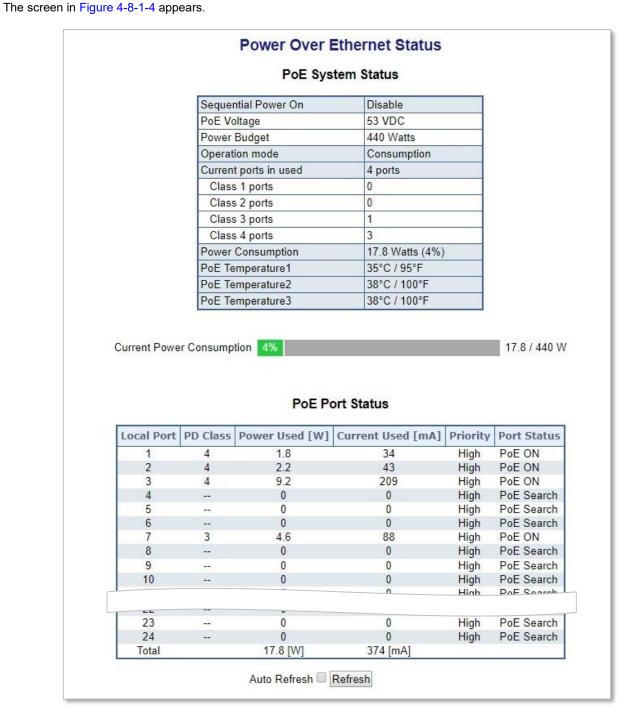

Figure 4-8-1-4:PoE Status Screenshot

The page includes the following fields:

Object	Description
Sequential Power On	Displays the current sequential power on mode.
PoE Voltage	Displays the current PoE voltage.
System Power Budget	Displays the maximum PoE power budget.
Operation Mode	Displays the current PoE operation mode.
Current Budget	Displays the current maximum PoE budget.
Current Ports in Use	Displays the current PoE ports in use.
• Class 1 ~ 4 ports	Displays the current ports of PoE class 1 ~ 4.
Power Consumption	Displays the current power consumption (total watts and percentage)
PoE Temperature	Displays the current operating temperature of the first PoE chip unit.
Current Power	Shows the total watts usage of Managed PoE Switch.
Consumption	
Total Power Reserved	Shows how much the total power is reserved for all PDs.
Temperature	Displays the current operating temperature of the PoE chip unit.
Local Port	This is the logical port number for this row.
PD Class	Displays the class of the PD attached to the port, as established by the
	classification process. Class 0 is the default for PDs. The PD is powered based on
	PoE Class level if system is working in Classification mode. A PD will return Class
	to 0 to 4 in accordance with the maximum power draw as specified by Table 4-8-1-
	1.
Power Used [W]	The Power Used shows how much power the PD currently is using.
Current Used [mA]	The Power Used shows how much current the PD currently is using.
• Priority	The Priority shows the port's priority configured by the user.
• Port Status	The Port Status shows the port's status.
Power Inline Mode	Displays per PoE port operating in mid-span, end-span or UPoE mode.
• Total	Shows the total power and current usage of all PDs.

Buttons

Auto-refresh :: Check this box to enable an automatic refresh of the page at regular intervals.

Refresh: Click to refresh the page immediately.

4.8.1.6 Port Sequential

This page allows the user to configure the PoE Ports started up interval time. The PoE Port will start up one by one as Figure 4-8-1-5 shows.

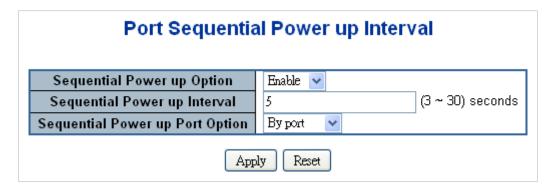

Figure 4-8-1-5: PoE Port Sequential Power Up Interval Configuration Screenshot

The PoE port will start up after the whole system program has finished running.

The page includes the following fields:

Object	Description
Sequential Power up	Allows user to enable or disable Sequential Power up function.
Option	
Sequential Power up	Allows user to configure the PoE Port Start Up interval time.
Interval	
Sequential Power up	There are two modes for Starting Up the PoE Port
Port Option	By Port: The PoE Port will start up by following Port number.
	By Priority: The PoE Port will start up by following the PoE Priority.

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

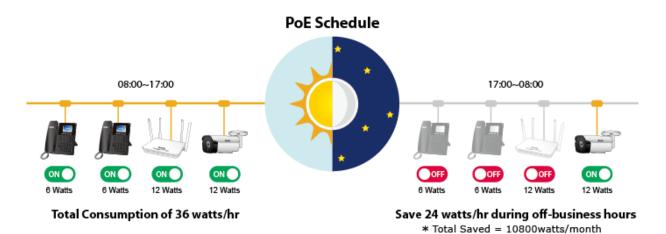

4.8.1.7 PoE Schedule

This page allows the user to define PoE schedule and schedule power recycle.

PoE Schedule

Besides being used as an IP Surveillance, the Managed PoE switch is certainly applicable to constructing any PoE network including VoIP and Wireless LAN. Under the trend of energy saving worldwide and contributing to the environmental protection on the Earth, the Managed PoE switch can effectively control the power supply besides its capability of giving high watts power.

The "PoE schedule" function helps you to enable or disable PoE power feeding for each PoE port during specified time intervals and it is a powerful function to help SMBs or Enterprises save power and budget.

Scheduled Power Recycling

The Managed PoE switch allows each of the connected PoE IP cameras to reboot in a specific time each week. Therefore, it will reduce the chance of IP camera crash resulting from buffer overflow. The screen in Figure 4-8-1-6 appears.

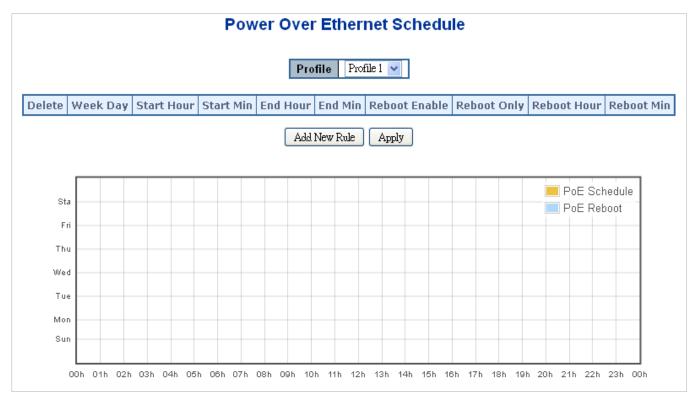

Figure 4-8-1-6: PoE Schedule Screenshot

Please press the **Add New Rule** button to start setting PoE Schedule function. You have to set PoE schedule to profile and then go back to PoE Port Configuration, and select "**Schedule**" mode from per port "**PoE Mode**" option. You can then indicate which schedule profile could be applied to the PoE port.

The page includes the following fields:

Object	Description
• Profile	Set the schedule profile mode. Possible profiles are:
	Profile1
	Profile2
	Profile3
	Profile4
Week Day	Allows user to set week day for defining PoE function should be enabled on the
	day.
Start Hour	Allows user to set what hour does PoE function enables.
Start Min	Allows user to set what minute does PoE function enables.
• End Hour	Allows user to set what hour does PoE function disables.
• End Min	Allows user to set what minute does PoE function disables.
Reboot Enable	Allows user to enable or disable whole PoE port reboot by PoE reboot schedule.

	Please be noticed that if you want to PoE schedule and PoE reboot schedule work
	at the same time, please use this function, and don't use Reboot Only function.
	This function offers administrator to reboot PoE device at indicate time if
	administrator has this kind of requirement.
Reboot Only	Allows user to reboot PoE function by PoE reboot schedule. Please be noticed that
	if administrator enable this function, PoE schedule will not to set time to profile. This
	function is just for PoE port reset at an indicated time.
Reboot Hour	Allows user to set what hour PoE reboots. This function only for PoE reboot
	schedule.
Reboot Min	Allows user to set what minute PoE reboots. This function only for PoE reboot
	schedule.

Buttons

Add New Rule : click to add new rule.

Apply: Click to apply changes

Delete : Check to delete the entry.

4.8.1.8 PoE Alive Check Configuration

The IGS-6325 PoE Switch can be configured to monitor connected PD's status in real-time via ping action. Once the PD stops working and without response, IGS-6325 PoE Switch is going to restart PoE port port power, and bring the PD back to work. It will greatly enhance the reliability and reduces administrator management burden.

This page provides you how to configure PD Alive Check. The screen in Figure 4-8-1-7 appears.

D 1			PD Ping Alive Check								
Port Mo	1ode	Ping PD IP Address	Interval Time(1	l0~300s)	Retry Co	unt(1~5)	Actio	n	Reboot Time(3	30~180s)	
* <all:< td=""><th>l > ▼</th><td>0.0.0.0</td><td></td><td>30</td><td></td><td>2</td><td><all></all></td><td>•</td><td></td><td>90</td></all:<>	l > ▼	0.0.0.0		30		2	<all></all>	•		90	
1 Disa	able ▼	0.0.0.0		30		2	None	₩		90	
2 Disa	able ▼	0.0.0.0		30		2	None	₩		90	
_				20		2	None	₩		90	

Figure 4-8-1-7: PD Alive Check Configuration Screenshot

The page includes the following fields:

Object	Description
• Mode	Allows user to enable or disable per port PD Alive Check function. As default value
	all ports are disabled.
Ping PD IP Address	This coulumn allows user to set PoE device IP address here for system making
	ping to the PoE device. Please be noticed that the PD's IP address must be set to
	the same network segment with IGS-6325 PoE Switch.
• Interval Time (10~300s)	This column allows user to set how long system should be issue a ping request to
	PD for detecting PD is alive or dead. Interval time range is from 10 seconds to 300
	seconds.
• Retry Count (1~5)	This column allows user to set how many times system rerry ping to PD. For
	example, if we set count 2, the meaning is that if system retry ping to the PD and
	the PD doesn't response continuously, the PoE port will be reset.
• Action	Allows user to set which action will be apply if the PD witout any response. IGS-
	6325 PoE Switch offers 3 actions as following.
	➤ PD Reboot: It menas system will reset the PoE port that connected the PD.
	➤ Reboot & Alarm: It means system will reset the PoE port and issue an alarm
	message via Syslog, SMTP.
	➤ Alarm: It means system will issue an alarm message via Syslog, SMTP.
• Reboot Time (30~180s)	This column allows user to set the PoE device rebooting time, due to there are so
	many kind of PoE device on the market and theyhave different rebooting time. The
	PD Alive-check is not a defining standard, so the PoE device on the market doesn't

report reboots done information to IGS-6325 PoE Switch, so user has to make sure how long the PD will be finished to boot, and then set the time value to this column. System is going to check the PD again according to the reboot time. If ou can not make sure precisely booting time, we suggest you to set it longer.

Buttons

Save : Click it to save changes.

: Click it to reset configuration which doesn't to be saved yet.

4.8.1.9 Port Power Consumption [1-24] (Only applies to switches installed with firmware after v1.2112bxxxxxx)

This page shows user per port PoE power consumption status and PoE port setting.

Port Power Consumption

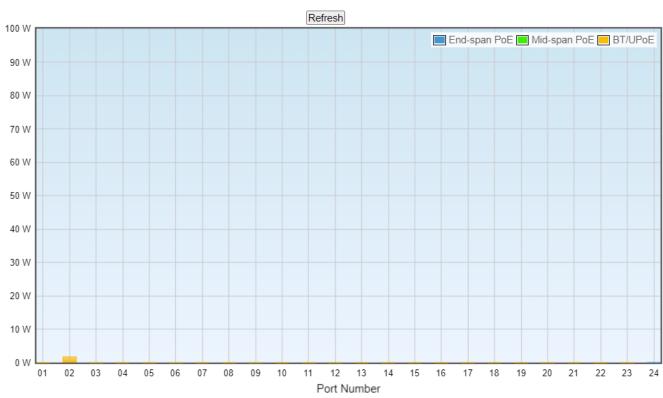

Figure 4-8-1-8: Graphical Port Power Consumption

4.8.1.10 LLDP PoE Neighbors

This page provides a status overview for all LLDP PoE neighbors. The displayed table contains a row for each port on which an LLDP PoE neighbor is detected. The columns hold the following information: The screen in Figure 4-8-1-9 appears.

Figure 4-8-1-9: LLDP PoE Neighbor Screenshot

Please note that administrator has to enable LLDP port from **LLDP configuration**, please refer to the following example (The screen in Figure 4-8-1-10 appears.) To enable LLDP function from port1 to port3, administrator has to plug a PD that supports PoE LLDP function, and then administrator is going to see the PoE information of the PD from LLDP.

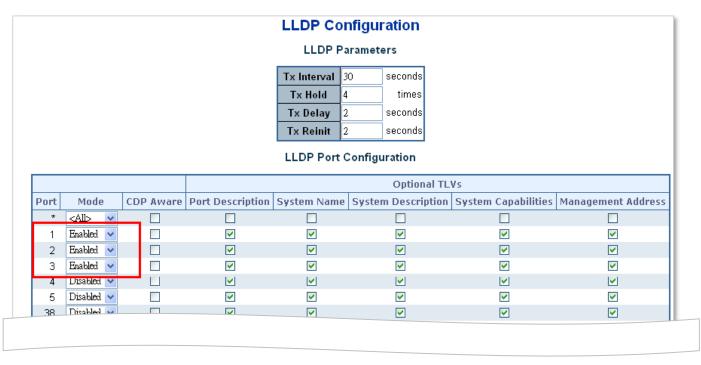

Figure 4-8-1-10: LLDP Configuration Screenshot

4.9 ONVIF

4.9.1 **ONVIF**

ONVIF (**Open Network Video Interface Forum**) is a global and open industry forum with the goal of facilitating the development and use of a global open standard for the interface of physical IP-based security products – or, in other words, to create a standard for how IP products within video surveillance and other physical security areas can communicate with each other. The ONVIF specification aims to achieve interoperability between network video products regardless of manufacturer.

4.9.1.1 ONVIF Device Search

Entries in the ONVIF Devices Table are shown on this page. The ONVIF Devices Table can be sorted first by VLAN ID, model, MAC Address and then by IP Address. The ONVIF Devices Table screen in Figure 4-9-1-1 appears.

Figure 4-9-1-1: ONVIF Devices Table Status Page Screenshot

Navigating the ONVIF Devices Table

The "Start from MAC address" and "VLAN", "Model", "MAC Address" and "IP Address" input fields allow the user to select the starting point in the ONVIF Devices Table. Clicking the "Refresh" button will update the displayed table which matches the ONVIF Devices Table.

The page includes the following fields:

Object	Description
• Port	This is the logical port number for this row.
Device Type	Entry of the ONVIF Device's Type
Device Name	Entry of the ONVIF Device's Name
Manufacturer	Entry of the ONVIF Device's Manufacturer
Model	Entry of the ONVIF Device's Model Name
• IP Address	Entry of the ONVIF Device's IP Address
MAC Address	Entry of the ONVIF Device's MAC address
• VLAN	Entry of the ONVIF Device's VLAN ID
Select Device	Select by ticking the ONVIF Devices to be added to the ONVIF Table List

Buttons

Search: Click to search the connecting ONVIF devices.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Auto-search: Automatic search occurs every 60 seconds.

4.9.1.2 ONVIF Device List

This page provides an overview of ONVIF Device entries. Each page shows up to 10 entries from the ONVIF Device table list, default being 10, selected through the "entries per page" input field. When first visited, the web page will show the first 10 entries at the beginning of the ONVIF Device table list as the screen in Figure 4-9-1-2 appears.

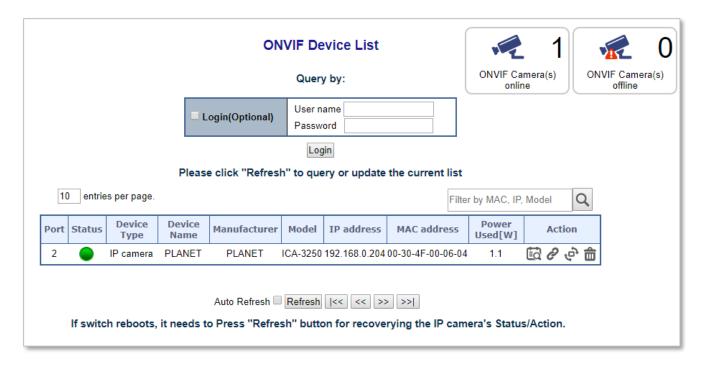

Figure 4-9-1-2: ONVIF Device List Page Screenshot

The page includes the following fields:

Object	Description
Login(Optional)	Allows for filling in one set of User name and Password.
• Port	This is the logical port number for this row.
• Status	Red: The ONVIF device is not active.
	Green: The ONVIF device is active.Entry of the ONVIF Device's Type
Device Type	Entry of the ONVIF Device's Type
Device Name	Entry of the ONVIF Device's Name
Manufacturer	Entry of the ONVIF Device's Manufacturer
Model	Entry of the ONVIF Device's Model Name
IP Address	Entry of the ONVIF Device's IP Address
MAC Address	Entry of the ONVIF Device's MAC address
Power Used [W]	The Power Used shows how much power the ONVIF device currently is using.
• Action	There are three actions:
	Access: Clicks for accessing the ONVIF device's Web UI.
	Reboot: Clicks for rebooting the ONVIF device.
	Delete: Clicks for deleting the ONVIF device from ONVIF Device List.

Buttons

Refresh: Click to refresh the page immediately.

Auto-refresh: Check this box to refresh the page automatically. Automatic refresh occurs every 30 seconds.

Less: To update the ONVIF device entries, press to go to the first page.

To update the ONVIF device entries, press to go to the front page.

To update the ONVIF device entries, press to go to the next page.

To update the ONVIF device entries, press to go to the final page.

4.9.1.3 Map Upload / Edit

This page allows the clients for uploading e-Map; the file size cannot be over 151k; the screen in Figure 4-9-1-3 appears.

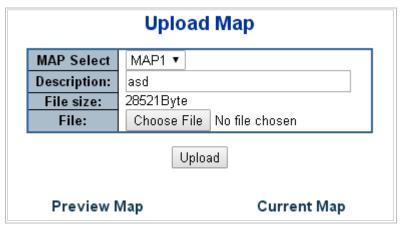

Figure 4-9-1-3: Map Upload / Edit Page Screenshot

The page includes the following fields:

Object	Description
MAP Select	Allows to select Map1/2/3 for uploading Map.
• Description	Indicates the map's description.
File size	Shows Map's size.
• File	Allows to choose and browse specific map file from laptop device.
Preview Map	The Preview use of Map.
Current Map	The Current use of Map.

Buttons

Choose File: Click to choose the file.

Upload: Click to upload the file.

4.9.1.4 Floor Map

This page allows the clients for planning the ONVIF devices with the uploaded e-Map. It can select the ONVIF devices from Device List and it also can modify the e-Map's Zoom and Scale as the screen in Figure 4-9-1-4 appears.

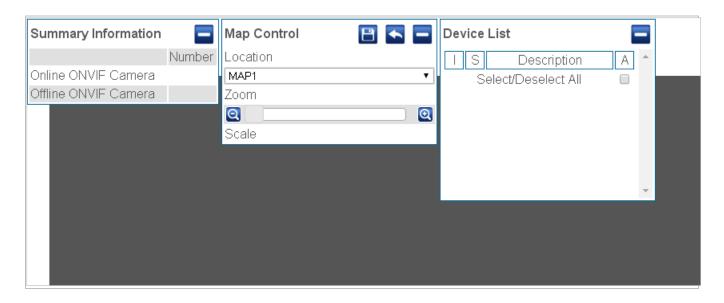

Figure 4-9-1-4: Floor Map Page Screenshot

Figure 4-9-1-5: Floor Map Page Screenshot – add ONVIF IP camera from Device List

Figure 4-9-1-5: Floor Map Page Screenshot – Display device information of selected ONVIF IP camera

The page includes the following fields:

Object	Description
Summary Information	Shows the number of Online and Offline ONVIF cameras.
Map Control	Allows to choose Location of Map1/2/3 and zoom in/out of Map.
Device List	Allows to select ONVIF devices.

4.10 Routing

4.10.1 IP Configuration

The IP Configuration includes the IP Configuration, IP Interface and IP Routes. The configured column is used to view or change the IP configuration. The maximum number of interfaces supported is 128 and the maximum number of routes is 128. The screen in Figure 4-10-1 appears.

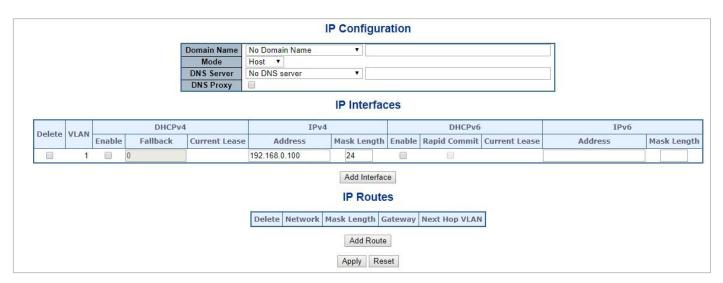

Figure 4-2-1: IP Configuration Page Screenshot

The current column is used to show the active IP configuration.

Object		Description			
IP Configurations	Domain Name	Configure the Switch Domain Name			
	Mode	Configure whether the IP stack should act as a Host or a Router. In			
		Host mode, IP traffic between interfaces will not be routed. In Router			
		mode traffic is routed between all interfaces.			
	DNS Server	This setting controls the DNS name resolution done by the switch.			
		The following modes are supported:			
		■ No DNS server			
		No DNS server will be used			
		■ Configure IPv4 or IPv6			
		Explicitly specify the name of local domain.			
		Make sure the configured domain name meets your			
		organization's given domain.			
		■ From any DHCPv6 interfaces			
		The first domain name offered from a DHCPv6 lease to a			
		DHCPv6-enabled interface will be used.			
		■ From this DHCPv6 interface			
		Specify from which DHCPv6-enabled interface a provided			

			domain name should be preferred.		
	DNS Prox	хy	When DNS proxy is enabled, system will relay DNS requests to the		
			currently configured DNS server, and reply as a DNS resolver to the		
			client devices on the network.		
IP Interface	Delete		Select this option to delete an existing IP interface.		
	VLAN		The VLAN associated with the IP interface. Only ports in this VLAN		
			will be able to access the IP interface. This field is only available for		
		T	input when creating a new interface.		
	IPv4	Enabled	Enable the DHCP client by checking this box.		
	DHCP	Fallback	The number of seconds for trying to obtain a DHCP lease.		
		Current Lease	For DHCP interfaces with an active lease, this column shows the		
			current interface address, as provided by the DHCP server.		
	IPv4	Address	Provide the IP address of this Managed Switch in dotted decimal		
			notation.		
		Mask Length	The IPv4 network mask, in number of bits (prefix length). Valid		
			values are between 0 and 30 bits for an IPv4 address.		
	DHCPv6	Enable	Enable the DHCPv6 client by checking this box. If this option is		
			enabled, the system will configure the IPv6 address of the interface		
			using the DHCPv6 protocol		
		Rapid Commit	Enable the DHCPv6 Rapid-Commit option by checking this box. If		
			this option is enabled, the DHCPv6 client terminates the waiting		
			process as soon as a Reply message with a Rapid Commit option is		
			received.		
			This option is only manageable when DHCPv6 client is enabled.		
		Current Lease	For DHCPv6 interface with an active lease, this column shows the		
			interface address provided by the DHCPv6 server		
	IPv6	Address	Provide the IP address of this Managed Switch. An IPv6 address is		
			in 128-bit records represented as eight fields of up to four		
			hexadecimal digits with a colon separating each field (:).		
		Mask Length	The IPv6 network mask, in number of bits (<i>prefix length</i>). Valid		
			values are between 1 and 128 bits for an IPv6 address.		
IP Routes	Delete	<u>I</u>	Select this option to delete an existing IP route.		
	Network		The destination IP network or host address of this route. Valid format		
			is dotted decimal notation or a valid IPv6 notation. A default route can		
			use the value 0.0.0.0 or IPv6 :: notation.		
	Mask Len	ıath	The destination IP network or host mask, in number of bits (prefix		
		-9	length).		
	Gateway		The IP address of the IP gateway. Valid format is dotted decimal		
	Jatoway		notation or a valid IPv6 notation. Gateway and Network must be of		
			the same type.		
			uio daino typo.		

N	Next Hop VLAN	The VLAN ID (VID) of the specific IPv6 interface associated with the		
		gateway.		

Buttons

Add Interface : Click to add a new IP interface. A maximum of 128 interfaces are supported.

Add Route : Click to add a new IP route. A maximum of 32 routes are supported.

Apply : Click to apply changes.

Reset : Click to undo any changes made locally and revert to previously saved values.

4.10.2 IP Status

IP Status displays the status of the IP protocol layer. The status is defined by the IP interfaces, the IP routes and the neighbor cache (ARP cache) status. The screen in Figure 4-10-2 appears.

IP Interfaces										
Interface	Туре		Address			9	Status	5		
OS:Io	LINK	00-0	00-00-00-00		<u< td=""><td>P LOOPBACK R</td><td>UNNI</td><td>NG MU</td><td>LTICAS</td><td>T></td></u<>	P LOOPBACK R	UNNI	NG MU	LTICAS	T>
OS:Io	IPv4	127	.0.0.1/8							
OS:Io	IPv6	fe80):1::1/64							
OS:Io	IPv6	::1/1	28							
VLAN1	LINK	00-3	30-4f-11-22-33		<u< td=""><td>P BROADCAST</td><td>RUNN</td><td>IING M</td><td>ULTICA</td><td>ST></td></u<>	P BROADCAST	RUNN	IING M	ULTICA	ST>
VLAN1	IPv4	192	.168.0.100/20							
VLAN1	IPv6	fe80):2::230:4fff:fe11:2	233/64						
			Network	Gatev		Status				
			127.0.0.1/32 192.168.0.0/24	127.0. VLAN1		<up host=""></up>				
			192.168.0.0/20		-	<up hw_rt=""></up>				
			224.0.0.0/4			<up></up>				
			::1/128	::1		<up host=""></up>				
Neighbour cache										
			IP Address			Link Address				
			192.168.0	.123 \	/LAN	1:00-30-4f-91-e	3-45			
		fe8	0:2::230:4fff:fe11:2	233 \	/LAN	1:00-30-4f-11-22	2-33			

Figure 4-10-2: IP Status Page Screenshot

The page includes the following fields:

Object		Description
• IP Interfaces	Interface	The name of the interface.
	Туре	The address type of the entry. This may be LINK or IPv4.
	Address	The current address of the interface (of the given type).
	Status	The status flags of the interface (and/or address).
IP Routes	Network	The destination IP network or host address of this route.
	Gateway	The gateway address of this route.
	Status	The status flags of the route.
Neighbor Cache	IP Address	The IP address of the entry.
	Link Adduses	The Link (MAC) address for which a binding to the IP address
	Link Address	given exists.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page.

4.10.3 Routing Information Base

This is IPv4/IPv6 route entry table. It is used to provide the route entries status information. See Figure 4-10-3 and Figure 4-10-4.

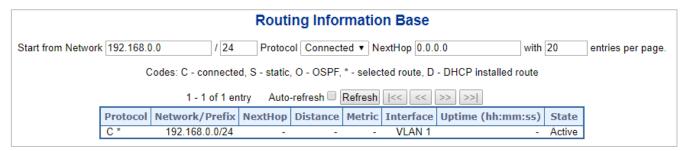

Figure 4-10-3: IP Status Page Screenshot

The following table provides IPv6 routing status.

Routing Information Base

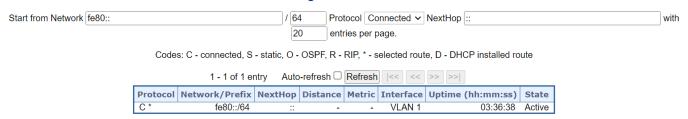

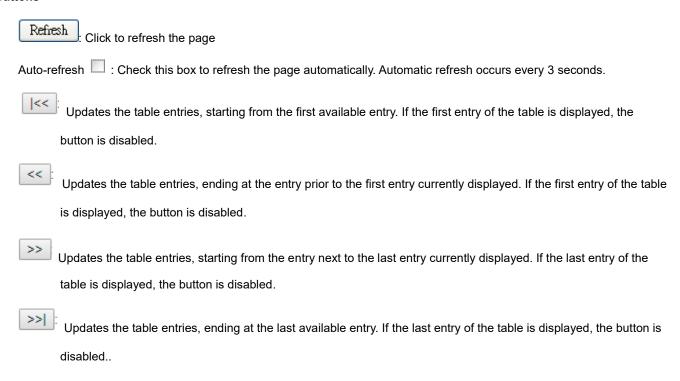

Figure 4-10-4: IPv6 Routing Information

The page includes the following fields:

Object	Description
Protocol	The protocol of the route.
	DHCP : The route is created by DHCP.
	Connected: The destination network is connected directly.
	Static: The route is created by user.
	OSPF: The route is created by OSPF.
Network/Prefix	Network and prefix (example 10.0.0.0/16) of the given route entry.
NextHop	The IP address of nexthop. Value '0.0.0.0' indicates the link is directly connected.
Distance	The distance of the route.
Metric	The metric of the route.
Interface	The interface where the ip packet is outgoing.
Uptime (hh:ss:mm)	The time till the route is created. The unit is second.
State	Indicate if the destination network is reachable or not.

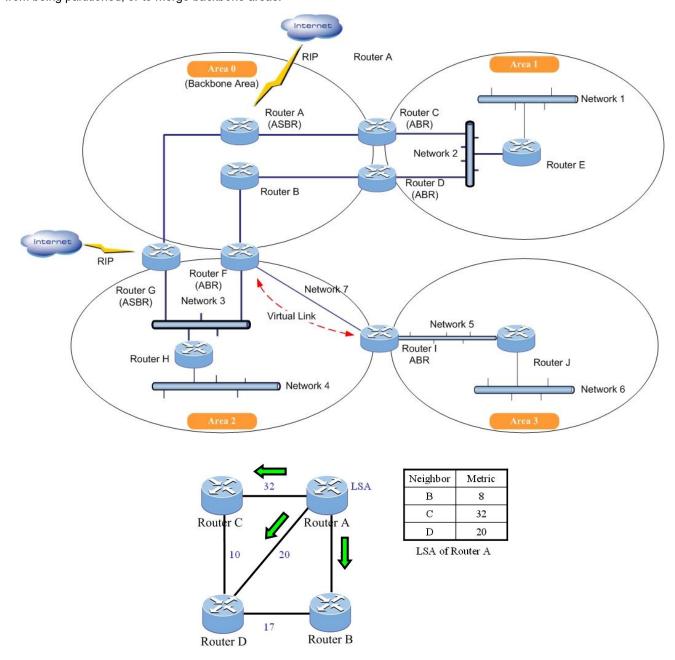

4.10.4 OSPF

Open Shortest Path First (**OSPF**) is a routing protocol for Internet Protocol (IP) networks. It uses a link state routing (LSR) algorithm and falls into the group of interior gateway protocols (IGPs), operating within a single autonomous system (AS).

To implement OSPF for a large network, you must first organize the network into logical areas to limit the number of OSPF routers that actively exchange Link State Advertisements (LSAs). You can then define an OSPF interface by assigning an IP interface configured on this switch to one of these groups. This OSPF interface will send and receive OSPF traffic to neighboring OSPF routers. You can further optimize the exchange of OSPF traffic by specifying an area range that covers a large number of subnetwork addresses. This is an important technique for limiting the amount of traffic exchanged between Area Border Routers (ABRs). And finally, you must specify a virtual link to any OSPF area that is not physically attached to the OSPF backbone. Virtual links can also be used to provide a redundant link between contiguous areas to prevent areas from being partitioned, or to merge backbone areas.

4.10.4.1 Global Configuration

This is OSPF router configuration table. It is a general group to configure the OSPF common router parameters. The screen in Figure 4-10-4-1 appears.

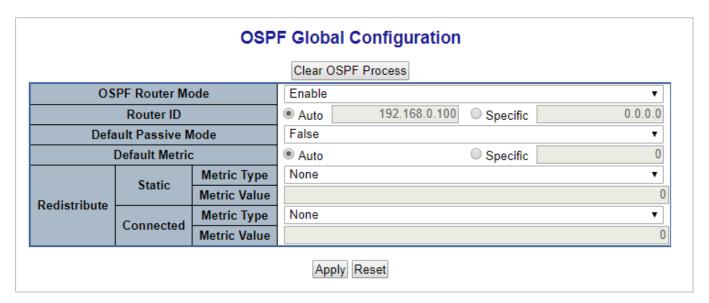

Figure 4-10-4-1: OSPF Global Configuration Page Screenshot

The page includes the following fields:

Object	Description			
OSPF Router Mode	Enable/Disable the OSPF router mode.			
Router ID	The OSPF Router ID in IPv4 address format(A.B.C.D).			
	When the router's OSPF Router ID is changed, if there is one or more fully adjacent			
	neighbors in current OSPF area, the new router ID will take effect after restart OSPF process.			
	Notice that the router ID should be unique in the Autonomous System and value '0.0.0.0' is			
	invalid since it is reserved for the default algorithm.			
	■ Auto: The default algorithm will choose the largest IP address assigned to the router.			
	■ Specific: User specified router ID.			
Default Passive Mode	Configure all interfaces as passive-interface by default.When an interface is configured as a			
	passive-interface, the OSFP routing updates sending is suppressed, therefore the interface			
	does not establish adjacencies (No OSPF Hellos). The subnet of all interfaces (both passive			
	and active) is advertised by the OSPF router.			

Default Metric	User specified default metric value for the OSPF routing protocol. The field is significant only		
	when the arugment 'IsSpecificDefMetric' is TRUE		
	■ Auto: The default metric is calculated automatically based on the routing protocols.		
	■ Specific: User specified default metric.		
Static Redistribute	■ The OSPF redistributed metric type for the connected interfaces.		
Metric Type	None: The static routes are not redistributed.		
	■ Specified Metric Value: User specified metric for the static routes.		
	■ External Type 1: External Type 1 of the static routes.		
	■ External Type 2: External Type 2 of the static routes.		
Static Redistribute	User specified metric value for the connected interfaces. The field is significant only when the		
Metric Value	arugment 'ConnectedRedistMetricType' is configured as 'metricTypeSpecified'.		
	The allowed range is 0 to 1677214.		
Connected	The OSPF redistributed metric type for the static routes.		
Redistribute Metric	■ None: The connected interfaces are not redistributed.		
Туре	■ Specified Metric Value: User specified metric for the connected interfaces routes.		
	■ External Type 1: External Type 1 of the connected interfaces routes.		
	■ External Type 2: External Type 2 of the connected interfaces routes.		
Connected	User specified metric value for the static routes.The field is significant only when the		
Redistribute Metric	arugment 'StaticRedistMetricType' is configured as 'metricTypeSpecified'.		
Value	The allowed range is 0 to 1677214.		

Buttons

Click to reset the current OSPF process.

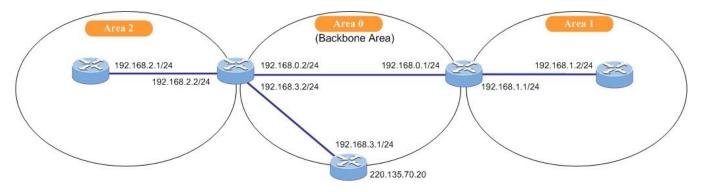

Save: Click to save changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

4.10.4.2 Network Area

OSPF protocol broadcast messages (i.e., Link State Advertisements) are restricted by area to limit their impact on network performance. Before assigning an Area ID to a specific OSPF interface, you must first specify the Area ID in this table. Each entry in this table identifies a logical group of OSPF routers that actively exchange **Link State Advertisements (LSAs)** to ensure that they share an identical view of the network topology. You can configure the area as a normal one which can send and receive external **Link State Advertisements (LSAs)**, a stubby area that cannot send or receive external LSAs, or a **not-so-stubby area (NSSA)** that can import external route information into its area.

Following is OSPF area configuration table. It is used to specify the OSPF enabled interface(s). When OSPF is enabled on the specific interface(s), the router can provide the network information to the other OSPF routers via those interfaces. The screen in Figure 4-10-4-2 appears.

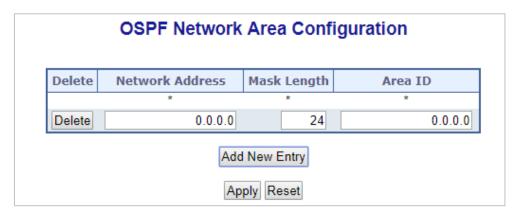

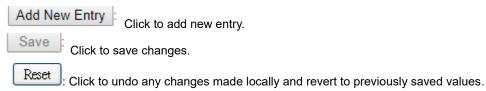

Figure 4-10-4-2: OSPF Network Area Page Screenshot

The page includes the following fields:

Object	Description	
Network Address	IPv4 network address.	
Mask Length	IPv4 network mask length.	
Area ID	The OSPF area ID.	

4.10.4.3 Passive Interface

This is OSPF router interface configuration table. The screen in Figure 4-10-4-3 appears.

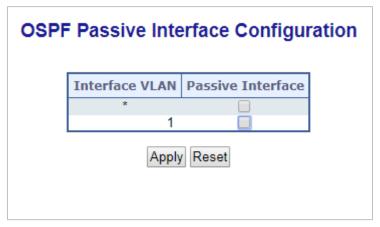

Figure 4-10-4-3: Passive Interface Page Screenshot

The page includes the following fields:

Object	Description
Interface	Interface identification.
Passive Interface	Enable the interface as OSPF passive-interface.

Buttons

Reset: Click to undo any changes made locally and revert to previously saved values.

4.10.4.4 Stub Area

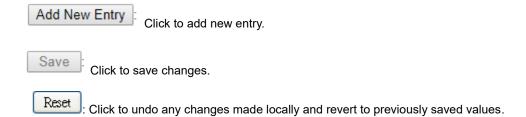

This is OSPF stub area configuration table. The configuration is used to reduce the link-state database size and therefore the memory and CPU requirement by forbidding some LSAs. The screen in Figure 4-10-4-10 appears.

Figure 4-10-4-10: Stub Area Page Screenshot

The page includes the following fields:

Object	Description
Area ID	The OSPF area ID.
No Summary	The value is true means the area is a totally stub area, which summary-LSAs(Type-3) except for the default route and AS-external-LSAs(Type-5) are blocked.
	The value is false means the area is a stub area, which summary-LSAs(Type-3) except for the default route are blocked.

4.10.4.5 Area Authentication

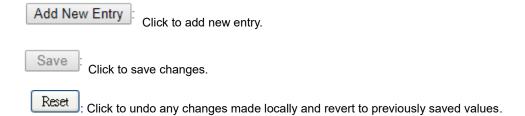

This is OSPF area authentication configuration table. It is used to applied the authentication to all the interfaces belong to the area. The screen in Figure 4-10-4-5 appears.

Figure 4-10-4-5: Area Authentication Page Screenshot

The page includes the following fields:

Object	Description
Area ID	The OSPF area ID.
Auth. Type	The authentication type on an area is applied to all the interfaces belong to that area.
	The authentication type on an IP interface or a virtual link overrides the authentication type on
	an area and is useful if different interfaces in the same area use different authentication types.
	Specify the authenticaton type.
	Simple Password: Simple password authentication.
	Message Digest: MD5 digest authentication.

4.10.4.6 Area Range

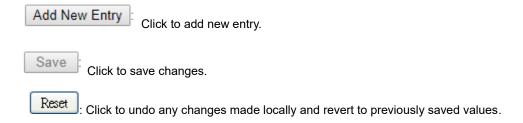

This is OSPF area range configuration table. It is used to summarize the intra area paths from a specific address range in one summary-LSA(Type-3) and advertised to other areas or configure the address range status as 'DoNotAdvertise' which the summary-LSA(Type-3) is suppressed. The area range configuration is used for Area Border Routers (ABRs) and only router-LSAs(Type-1) and network-LSAs (Type-2) can be summarized. The AS-external-LSAs(Type-5) cannot be summarized because the scope is OSPF autonomous system (AS). The AS-external-LSAs(Type-7) cannot be summarized because the feature is not supported yet.. The screen in Figure 4-10-4-6 appears.

Figure 4-10-4-6: Area Range Page Screenshot

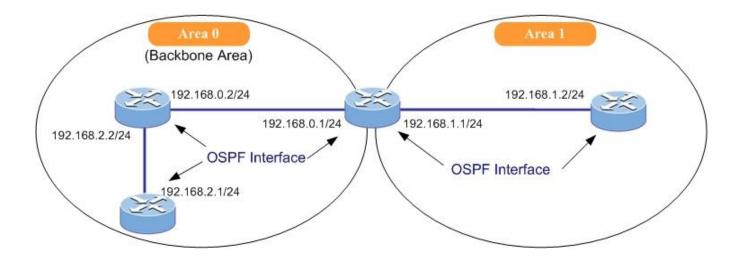

The page includes the following fields:

Object	Description
Area ID	The OSPF area ID.
Network Address	IPv4 network address.
Mask Length	IPv4 network mask length.
Advertised	When the value is true, it summarizes intra area paths from the address range in one
	summary-LSA(Type-3) and advertised to other areas. Otherwise, the intra area paths from
	the address range are not advertised to other areas.
Auto/Specific	When 'Auto' is selected, the cost value is set to 0 automatically and isn't allowed to be
	configured.
Cost	User specified cost (or metric) for this summary route. It is allowed to be configured only
	when 'Specific' is selected and the allowed range is 0 to 65535 The allowed range is 1 to
	16777215 and the default setting is 'auto cost' mode.

4.10.4.7 Interface Configuration

This is interface configuration parameter table. The screen in Figure 4-10-4-7 appears.

						OS	PF Interfa	ce Config	juration				
Interface	Priority		Cost		FastHell	loPackets	Hello	Interval Dead	Retransmit	Auth. Type	Change	Simple Password	MD Key
*	1	<all></all>	¥	0		2	10	40	5	<all> ▼</all>	*	*	*
VLAN 1	1	Auto	▼	0		2	10	40	5	Area Configuration ▼			e
	Apply Reset												

Figure 4-10-4-7: Interface Configuration Page Screenshot

The page includes the following fields:

Object	Description
Interface	Interface identification.
Priority	User specified router priority for the interface.
	The allowed range is 0 to 255 and the default value is 1.
Cost	User specified cost for this interface. It's link state metric for the interface. The field is
	significant only when 'IsSpecificCost' is TRUE.
	The allowed range is 1 to 65535 and the default setting is 'auto cost' mode.
FastHelloPackets	How many Hello packets will be sent per second.
	The allowed range is 1 to 10 and the default setting is disabled.
Hello Interval	How many Hello packets will be sent per second.
	The allowed range is 1 to 65535 and the default value is 10 (seconds).

	Router C Router A 10 20 8 Hello Packet Router B Hello Packet
Dead Interval	The time interval (in seconds) between hello packets.
	The allowed range is 1 to 65535 and the default value is 40 (seconds).
Retransmit Interval	The time interval (in seconds) between link-state advertisement(LSA) retransmissions for
	adjacencies.
	The allowed range is 1 to 65535 and the default value is 5 (seconds).
Auth. Type	The authentication type.
	■ Simple Password: It's using a plain text authentication. A password must be
	configured, but the password can be read by sniffer the packets.
	■ Message Digest: It's message-digest algorithm 5 (MD5) authentication. Keying
	material must also be configured. This is the most secure method.
	■ Null Authentication: No authentication.
	■ Area Configuration: Refer to Area authentication setting.
Change Simple	It is used to change the simple password (fill with plain text). The allowed input length is 1 to
Password	8.
MD Key	Click the icon to edit the message digest key for the entry.

Buttons

Save : Click to save changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

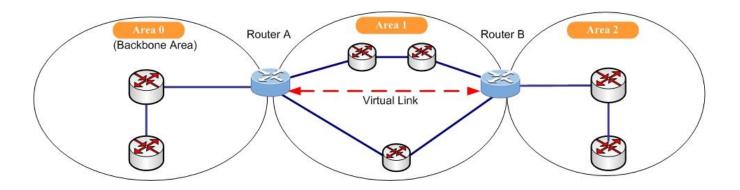

4.10.4.8 Virtual Link

All OSPF areas must connect to the backbone. If an area does not have a direct physical connection to the backbone, you can configure a virtual link that provides a logical path to the backbone. To connect an isolated area to the backbone, the logical path can cross a single nonbackbone area to reach the backbone. To define the path, you must specify one endpoint on the ABR that connects the isolated area to the common nonbackbone area, and the other endpoint on the ABR that connects this common nonbackbone area and the backbone itself. (However, note that you cannot configure a virtual link that runs through a stub or NSSA area.)

Virtual links can also be used to create a redundant link between any area and the backbone to help prevent partitioning, or to connect two existing backbone areas into a common backbone.

To configure a virtual link, specify the transit area through which the endpoint routers connect, and the address of the router on this side of the link.

Following is OSPF virtual link configuration table. The virtual link is established between 2 ABRs to overcome that all the areas have to be connected directly to the backbone area. The screen in Figure 4-10-4-8 appears.

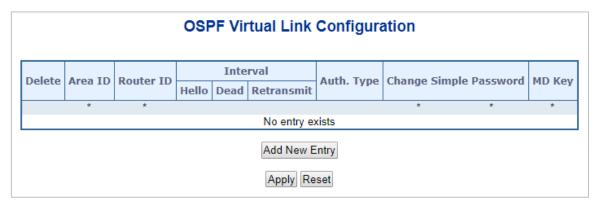

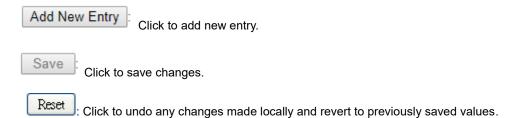

Figure 4-10-4-8: Virtual Link Page Screenshot

The page includes the following fields:

Object	Description
Area ID	OSPF Area ID.
Router ID	OSPF router ID.
Hello Interval	The time interval (in seconds) between hello packets.
	The allowed range is 1 to 65535 and the default value is 10 (seconds).
Dead Interval	The number of seconds to wait until the neighbour is decalred to be dead.
	The allowed range is 1 to 65535 and the default value is 40 (seconds).
Retransmit Interval	The time interval (in seconds) between link-state advertisement(LSA) retransmissions for
	adjacencies.
	The allowed range is 1 to 65535 and the default value is 5 (seconds).
Auth. Type	The authentication type on an area.
	■ Simple Password: It's using a plain text authentication. A password must be
	configured, but the password can be read by sniffer the packets.
	■ Message Digest: It's message-digest algorithm 5 (MD5) authentication. Keying
	material must also be configured. This is the most secure method.
	■ Null Authentication: No authentication.
	■ Area Configuration: Refer to Area authentication setting.
Change Simple	It is used to change the simple password (fill with plain text).
Password	The allowed input length is 1 to 8.
MD Key	Click the icon to edit the message digest key for the entry.

4.10.4.9 Global Status

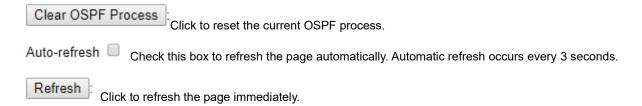

This is OSPF router status table. It is used to provide the OSPF router status information. The screen in Figure 4-10-4-9 appears.

Figure 4-10-4-9: Virtual Link Page Screenshot

The page includes the following fields:

Object	Description
Router ID	OSPF router ID.
SPF Delay	Delay time (in seconds)of SPF calculations.
SPF Hold Time	Minimum hold time (in milliseconds) between consecutive SPF calculations.
SPF Max. Wait Time	Maximum wait time (in milliseconds) between consecutive SPF calculations.
Last Executed SPF	Time (in milliseconds) that has passed between the start of the SPF algorithm execution and
Time Stamp	the current time.
Min. LSA Interval	Minimum interval (in seconds) between link-state advertisements.
Min. LSA Arrival	Maximum arrival time (in milliseconds) of link-state advertisements.
External LSA Count	Number of external link-state advertisements.
External LSA	Number of external link-state checksum.
Checksum	
Attached Area Count	Number of areas attached for the router.

4.10.4.10 Area Status

This is OSPF network area status table. It is used to provide the OSPF network area status information. The screen in Figure 4-10-4-10 appears.

Figure 4-10-4-10: Area Status Page Screenshot

The page includes the following fields:

Object	Description
Area ID	The Area ID.
Backbone	Indicate if it's backbone area or not.
Area Type	The area type.
Active Interfaces	Number of active interfaces attached in the area.
Auth. Type	The authentication type in the area.
SPF Executed Times	Number of times SPF algorithm has been executed for the particular area.
LSA Count	Number of the total LSAs for the particular area.
Router LSA Count	Number of the router-LSAs(Type-1) of a given type for the particular area.
Router LSA	The the router-LSAs(Type-1) checksum.
Checksum	
Network LSA Count	Number of the network-LSAs(Type-2) of a given type for the particular area.
Network LSA	The the network-LSAs(Type-2) checksum.
Checksum	
Summary LSA Count	Number of the summary-LSAs(Type-3) of a given type for the particular area.
Summary LSA	The the summary-LSAs(Type-3) checksum.
Checksum	
ASBR Summary LSA	Number of the ASBR-summary-LSAs(Type-4) of a given type for the particular area.
Count	
ASBR Summary LSA	The the ASBR-summary-LSAs(Type-4) checksum.
Checksum

4.10.4.11 Neighbor Status

This is OSPF IPv4 neighbor status table. It is used to provide the OSPF neighbor status information. The screen in Figure 4-10-4-11 appears.

Figure 4-10-4-11: Neighbor Status Page Screenshot

The page includes the following fields:

Object	Description
Neighbor ID	The Neighbor ID.
Priority	The priority of OSPF neighbor. It indicates the priority of the neighbor router. This item is used
	when selecting the DR for the network. The router with the highest priority becomes the DR.
State	The state of OSPF neighbor. It indicates the functional state of the neighbor router.
Dead Time	Dead timer. It indicates the amount of time remaining that the router waits to receive an OSPF
	hello packet from the neighbor before declaring the neighbor down.
Interface Address	The IP address.
Interface	The network interface.

Buttons

Auto-refresh Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

4.10.4.12 Interface Status

This is OSPF interface status table. It is used to provide the OSPF interface status information. The screen in Figure 4-10-4-12 appears.

Figure 4-10-4-12: Interface Status Page Screenshot

The page includes the following fields:

Object	Description
Interface	Interface identification.
Interface Address	IPv4 network address.
Area ID	The OSPF area ID.
Router ID	The OSPF router ID.
State	The state of the link.
DR ID	The router ID of DR.
DR Address	The IP address of DR.
BDR ID	The router ID of BDR.
BDR Address	The IP address of BDR.
Priority	The OSPF priority. It helps determine the DR and BDR on the network to which this interface is
	connected.
Cost	The cost of the interface.
Hello	Hello timer. A time interval that a router sends an OSPF hello packet.
Dead	Dead timer. Dead timer is a time interval to wait before declaring a neighbor dead. The unit of time is
	the second.
Wait	This interval is used in Wait Timer. Wait timer is a single shot timer that causes the interface to exit
	waiting and select a DR on the network. Wait Time interval is the same as Dead time interval.
Retransmit	Retransmit timer. A time interval to wait before retransmitting a database description packet when it
	has not been acknowledged.
Hello Timer	Hello due timer. An OSPF hello packet will be sent on this interface after this due time.
Nbr Count	Neighbor count. This is the number of OSPF neighbors discovered on this interface.
Adjacent Nbr	Adjacent neighbor count. This is the number of routers running OSPF that are fully adjacent with this
Count	router.
Passive	Indicate if the interface is passive interface.
Transmit Delay	The estimated time to transmit a link-state update packet on the interface.

Buttons

Auto-refresh Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Click to refresh the page immediately.

4.10.5 OSPF Database

4.10.5.1 Global Configuration

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from entry keys" input field allows the user to change the starting point in this table. Clicking the Refresh button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a Refresh button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

Figure 4-10-5-1: OSPF Link State Database

The following table explains each item shown in the database.

Object	Description		
Area ID	The OSPF area ID of the link state advertisement. It is not required for external LSA.		
Link Status Type	The type of the link state advertisement.		
Link State ID	The OSPF link state ID. It identifies the piece of the routing domain that is being described		
	by the LSA.		
Advertising Router	The advertising router ID which originated the LSA.		
Age	The time in seconds since the LSA was originated.		
Sequence	The LS sequence number of the LSA.		
Checksum	The checksum of the LSA contents.		
Router Link Count	The link count of the LSA. The field is significant only when the link state type is 'Router Link		
	State' (Type 1).		

4.10.6 OSPFv3 (Only applies to switches installed with firmware after v1.2112bxxxxxx)

4.10.6.1 Global Configuration

This is OSPF6 router configuration table. It is a general group to configure the OSPF6 common router parameters.

OSPF6 Global Configuration

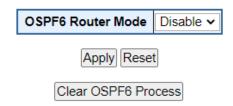

Figure 4-10-6-1: OSPF6 Global Configuration

Object	Description
OSPF Router Mode	Enable/Disable the OSPF6 router mode.
Router ID	The OSPF6 Router ID in IPv4 address format(A.B.C.D).
	When the router's OSPF6 Router ID is changed, if there is one or more fully adjacent
	neighbors in current OSPF6 area, the new router ID will take effect after restart OSPF6
	process. Notice that the router ID should be unique in the Autonomous System and value
	'0.0.0.0' is invalid since it is reserved for the default algorithm.
	Auto: The default algorithm will choose the largest IP address assigned to the router.
	Specific: User specified router ID.
	The allowed range is from 0.0.0.1 to 255.255.254.
Static Redistribute	The OSPF redistributeenabled for the static routes or not.
	Enable: The static routes are redistributed.
	Disable : The static routes are not redistributed
Connected	The OSPF redistribute enabled for connected route or not.
Redistribute	Enable: The connected interfaces are redistributed.
	Disbale: The connected interfaces are not redistributed.
Administrative	The OSPF6 administrative distance.
Distance	

Button:

Apply: Click to reset the current OSPF6 process.

Reset: Click to apply changes.

Clear OSPF6 Process: Click to undo any changes made locally and revert to previously saved values.

4.10.6.2 Passive Interface

This is OSPF6 router interface configuration table.

OSPF6 Passive Interface Configuration

Figure 4-10-6-2: OSPF6 Passive Interface

OSPF6 router interface configuration table.

Object	Description	
Interface	Interface identification.	
Interface Area ID	The OSPF6 interface Area ID.Only valid if 'is_specific_id' is true	

4.10.6.3 Stub Area

This is OSPF6 stub area configuration table. The configuration is used to reduce the link-state database size and therefore the memory and CPU requirement by forbidding some LSAs.

OSPF6 Area Stub Configuration

Figure 4-10-6-3: Stub Area

Object	Description
Delete	Check to delete the entry. It will be deleted during the next save.
Area ID	The OSPF6 area ID.
No Summary	The value is true to configure the inter-area routes do not inject into this stub area.

4.10.6.4 Area Range

This is OSPF6 area range configuration table. It is used to summarize the intra area paths from a specific address range in one summary-LSA(Type-0x2003) and advertised to other areas or configure the address range status as 'DoNotAdvertise' which the summary-LSA(Type-0x2003) is suppressed. The area range configuration is used for Area Border Routers (ABRs) and only router-LSAs(Type-0x2001) and network-LSAs (Type-0x2002) can be summarized. The AS-external-LSAs(Type-0x4005) cannot be summarized because the scope is OSPF6 autonomous system (AS). The AS-external-LSAs(Type-0x4007) cannot be summarized because the feature is not supported yet.

OSPF6 Area Range Configuration

Figure 4-10-6-4: Area Range Configuration

The table below explains the items and the settings on this page.

Object	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
Area ID	The OSPF6 area ID.	
Network Address	IPv6 network address.	
Mask Length	IPv6 network mask length.	
Advertised	When the value is true, it summarizes intra area paths from the address range in one Inter-	
	Area Prefix LSA(Type-0x2003) and advertised to other areas. Otherwise, the intra area paths	
	from the address range are not advertised to other areas.	
Auto/Specific	When 'Auto' is selected, the cost value is set to 0 automatically and isn't allowed to be	
	configured.	
Cost	User specified cost (or metric) for this summary route. It is allowed to be configured only	
	when 'Specific' is selected. The allowed range is 0 to 16777215 and the default setting is	
	'auto cost' mode.	

4.10.6.5 Interface Configuration

This is interface configuration parameter table.

OSPF6 Interface Configuration

Interface Dr	Deioeity	Priority Passive Interfac	Cost			Interval		
Titterrace	Priority	Passive Interrace		COSC		Hello	Dead	Retransmit
*	1		<>	Y 1	1	10	40	5
VLAN 1	1		Auto	~ 1	1	10	40	5

Apply Reset

Figure 4-10-6-5: OSPF Interface Configuration

The table below explains the items and the settings on this page.

Object	Description	
Interface	Interface identification.	
Priority	User specified router priority for the interface. The allowed range is 0 to 255 and the default	
	value is 1.	
Passive Interface	Indicates whether the interface is passive or not	
Cost	User specified cost for this interface. It's link state metric for the interface. The field is	
	significant only when 'IsSpecificCost' is TRUE. The allowed range is 1 to 65535 and the	
	default setting is 'auto cost' mode.	
Hello Interval	The time interval (in seconds) between hello packets. The allowed range is 1 to 65535 and	
	the default value is 40 (seconds).	
Retransmit Interval	The time interval (in seconds) between link-state advertisement(LSA) retransmissions for	
	adjacencies. The allowed range is 3 to 65535 and the default value is 5 (seconds).	

4.10.6.6 Global Status

This is OSPF6 router status table. It is used to provide the OSPF6 router status information..

OSPF6 Global Status

Clear OSPF6 Process Auto-refresh Refresh
OSPF6 is disabled

Figure 4-10-6-6: OSPF Global Status

The table below explains the items on this page.

Object	Description	
Router ID	OSPF6 router ID.	
SPF Delay	Delay time (in seconds)of SPF calculations.	
SPF Hold Time	Minimum hold time (in milliseconds) between consecutive SPF calculations.	
SPF Max. Wait Time	Maximum wait time (in milliseconds) between consecutive SPF calculations.	
Last Executed SPF	Time (in milliseconds) that has passed between the start of the SPF algorithm execution and	
Time Stamp	the current time.	
Attached Area Count	Number of areas attached for the router	

4.10.6.7 Neighbor Status

This is OSPF6 IPv6 neighbor status table. It is used to provide the OSPF6 neighbor status information.

OSPF6 Neighbor Status

Auto-refresh Refresh

Neighbor ID Priority State Dead Time Interface Address Interface

No entry exists

Figure 4-10-6-7: OSPF Neighbor Status

Object	Description	
Neoghbor ID	The Neighbor ID.	
Priority	The priority of OSPF6 neighbor. It indicates the priority of the neighbor router. This item is	
	used when selecting the DR for the network. The router with the highest priority becomes the	
	DR.	
State	The state of OSPF6 neighbor. It indicates the functional state of the neighbor router.	
Dead Time	Dead timer. It indicates the amount of time remaining that the router waits to receive an	
	OSPF6 hello packet from the neighbor before declaring the neighbor down.	
Interface Address	The IP address.	
Interface	The network interface.	

4.10.6.8 Interface Status

This is OSPF6 interface status table. It is used to provide the OSPF6 interface status information.

OSPF6 Interface Status

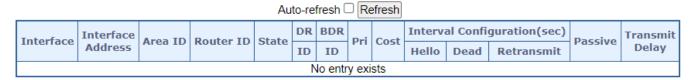

Figure 4-10-6-7: OSPF Interface Status

Object	Description	
Interface	Interface identification.	
Interface Address	The IP address.	
Area ID	The OSPF6 area ID	
Router ID	The OSPF6 router ID.	
State	The state of the link.	
DR ID	The router ID of DR.	
BRD ID	The router ID of BDR.	
Priority	The OSPF6 priority. It helps determine the DR and BDR on the network to which this interface	
Priority	is connected.	
Cost	The cost of the interface.	
Hello	Hello timer. A time interval that a router sends an OSPF6 hello packet.	
Dead	Dead timer. Dead timer is a time interval to wait before declaring a neighbor dead. The unit of	
Dead	time is the second.	
Retransmit	Retransmit timer. A time interval to wait before retransmitting a database description packet	
Retransmit	when it has not been acknowledged.	
Passive	Indicate if the interface is passive interface.	
Transmit Delay	The estimated time to transmit a link-state update packet on the interface.	

4.10.6.9 Routing Status

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from ID" input field allow the user to change the starting point in this table. Clicking the button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

Figure 4-10-6-8: OSPF Routing Status

Object	Description		
	The OSPF6 route type.		
	Intra Area: The destination is an OSPF6 route which is located on intra-area.		
Route Type	Inter Area: The destination is an OSPF6 route which is located on inter-area.		
Route Type	Border Router: The destination is a border router.		
	External Type-1: The destination is an external Type-1 route.		
	External Type-2: The destination is an external Type-2 route.		
Destination	Network and prefix (example 10.0.0.0/16) of the given route entry.		
Area	It indicates which area the route or router can be reached via/to.		
NextHop	An Ipv6 address represented as human readable test as specified in RFC5952		
Cost	The cost of the route.		
As Cost	The cost of the route within the OSPF6 network. It is valid for external Type-2 route and		
As Cost	always '0' for other route type.		
	The border router type of the OSPF6 route entry.		
	i-ABR: The border router is an ABR.		
Border Router Type	i-ASBR: The border router is an ASBR located on Intra-area.		
	I-ASBR: The border router is an ASBR located on Inter-area.		
	i-ABR/ASBR: The border router is an ASBR attached to at least 2 areas.		
Interface	The interface where the ip packet is outgoing.		
IsConnected	The destination is connected directly or not.		

4.10.7 OSPFv3 Database (Only applies to switches installed with firmware after v1.2112bxxxxxx)

4.10.7.1 General Database

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from entry keys" input field allows the user to change the starting point in this table. Clicking the button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

Figure 4-10-7-1: OSPF6 General Database

Object	Description		
Area ID	The OSPF6 area ID of the link state advertisement. It is not required for external LSA.		
Link State Type	The type of the link state advertisement.		
Link State ID	The OSPF6 link state ID. It identifies the piece of the routing domain that is being described		
	by the LSA.		
Advertising Router	The advertising router ID which originated the LSA.		
Age	The time in seconds since the LSA was originated.		
Sequence	The LS sequence number of the LSA.		

4.10.8 RIP (Only applies to switches installed with firmware after v1.2112bxxxxxx)

4.10.8.1 Global Configuration

This is RIP router configuration table. It is a general group to configure the RIP common router parameters.

Clear RIP Process **RIP Router Mode** Disable Version Default Update 30 180 Timers Invalid Garbage-Collection 120 Mode Disable Static Metric Value 1 Auto Specific Mode Disable Connected Metric Value 1 Auto Specific Redistribute Mode Disable **OSPF** Metric Value 1 Auto Specific **Default Metric Value Default Route** Disable v **Default Passive Mode** Disable Administrative Distance 120

RIP Global Configuration

Apply Reset

Figure 4-10-8-1: RIP Global Configuration

The following table shows how to configure the RIP protocol.

Object	Description
RIP Router Mode	Enable/Disable the RIP router mode.
	Enable: Enable the RIP router mode.
	Disable: Disable the the RIP router mode.
Update Timer	RIP version support.
	Default: Base on the default version process.The router sends RIPv2 and accepts both
	RIPv1 and RIPv2. When the router receives either version of REQUESTS or triggered
	updates packets, it replies with the appropriate version.
	Version 1: Receive/Send RIPv1 only.
	Version 2: Receive/Send RIPv2 only.
Invalid Timer	The advertising router ID which originated the LSA.
Garbage Collection	The garbage collection timer is the number of seconds after which a route will be deleted. The
Timer	allowed range is 5 to 2147483.
Static Redistribute	Indicate if the router redistribute the static routes intothe RIP domain or not.

	Enable: Enable static routes redistribution.
	Disable: Enable static routes redistribution.
Static Redistribute	User specified metric value for the static routes. The field is significant only when the
	argument 'StaticRedistIsSpecificMetric' is TRUE. If the specific metric setting is removed
	while the static redistributed mode is enabled, the router will updates the original static
	redistributed routes with metric value 16 before updates to the new metric value
Metric Value	The allowed range is 1 to 16.
	Auto: The redistributed metric value is refer to redistributed default metric value.
	Specific: User specified metric for the static routes.
	Indicate if the router redistribute the directly connected routes with RIP not enabled into the
Connected	RIP domain or not.
Redistribute Mode	Enable: Enable connected routes redistribution.
	Disable: Enable connected routes redistribution.
	User specified metric value for the connected interfaces. The field is significant only when the
	argument 'ConnectedRedistIsSpecificMetric' is TRUE. If the specific metric setting is removed
Connected	while the connected redistributed mode is enabled, the router will updates the original
Redistribute Metric	connected redistributed routes with metric value 16 before updates to the new metric value.
Value	The allowed range is 1 to 16.
	Auto: The redistributed metric value is refer to redistributed default metric value.
	Specific: User specified metric for the connected routes.
	Indicate if the router redistribute the OSPF routes into the RIP domain or not. The field is
OSPF Redistribute	significant only when the OSPF protocol is supported on the device.
Mode	Enable: Enable OSPF routes redistribution.
	Disable: Enable OSPF routes redistribution.
	User specified metric value for the RIP routes. The field is significant only when the OSPF
	protocol is supported on the device and argument 'OspfRedistIsSpecificMetric' is TRUE. If the
	specific metric setting is removed while the OSPF redistributed mode is enabled, the router
OSPF Redistribute	will updates the original OSPF redistributed routes with metric value 16 before updates to the
Metric Value	new metric value
	The allowed range is 1 to 16.
	Auto: The redistributed metric value is refer to redistributed default metric value.
	Specific: User specified metric for the OSPF routes.
Redistribute Default	The RIP default redistributed metric.It is used when the metric value isn't specificed for the
Metric Value	redistributed protocol type.The allowed range is 1 to 16.
Redistribute Default	The DID default route redictribution
Route	The RIP default route redistribution.
Default Passive Mode	Configure all interfaces as passive-interface by default.
Administrative	The PID administrative distance The allowed range is 1 to 255
Distance	The RIP administrative distance. The allowed range is 1 to 255.

Button:

Clear RIP Process: Click to reset the current RIP process.

Apply: Click to apply changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

4.10.8.2 RIP Network Configuration

This is RIP network configuration table. It is used to specify the RIP enabled interface(s). When RIP is enabled on the specific interface(s), the router can provide the network information to the other RIP routers via those interfaces. The maximum number of the RIP network segment entries is 32.

RIP Network Configuration

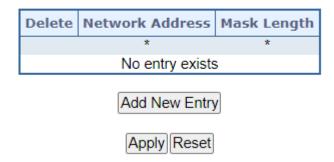

Figure 4-10-8-2: RIP Network Configuration

The following table shows how to configure RIP network.

Object	Description
Delete	Check to delete the entry. It will be deleted during the next save.
Network Address	IPv4 network address.
Mask Length	IPv4 network mask length.

4.10.8.3 Neighbors Configuration

RIP Neighbor Configuration

Figure 4-10-8-3: RIP Neighbor Configuration

The following table shows how to configure RIP neighbor.

Object	Description
Delete	Check to delete the entry. It will be deleted during the next save.
Network Address	lpv4 address encoded as "a.b.c.d", where a-d is a base-10 human readable integer in the
	range [0-255]The neighbor address can be an unicast(excluding loopback), broadcast, or
	network IP address.

4.10.8.4 Passive Interface Configuration

RIP Passive Interface Configuration

Figure 4-10-8-4: RIP Passive Interface

The following table shows how to configure RIP passive interface.

Object	Description
Interface	Interface identification.
Passive Interface	Enable the interface as RIP passive-interface.

4.10.8.5 Offset-list Configuration

This is RIP offset-list configuration table. The maximum number of the RIP offset-list entries is 130.

RIP Offset-List Configuration

Figure 4-10-8-5: RIP Offset-List Configuration

The following table shows how to configure RIP offset list.

Object	Description
Delete	Check to delete the entry. It will be deleted during the next save.
V// AN ID	The VLAN interface which the offset list applies to. The range of VLAN ID is from 0 to 4095. 0
VLAN ID	means that the offset list applies to all interfaces.
Direction	The direction to add the offset to routing metric update.
	In: Apply to the inbound direction.
	Out: Apply to the outbound direction.
Access List Name	Access-list name. The valid name string length is from 1 to 31 and allows all printable
	characters excluding space character.
Offset Metric	The offset to incoming or outgoing routing metric. The allowed range is 0 to 16.

Button:

Add New Entry : Click to reset the current RIP process.

Apply: Click to apply changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

4.10.8.6 Global Status

RIP Global Status

Clear RIP Process Auto-refresh Refresh

Status Information
RIP Router Mode Disabled

Figure 4-10-8-6: RIP Global Status

Object	Description
	This indicates the global rip version. By default, the router sends RIPv2 and accepts both
	RIPv1 and RIPv2. When the router receive either version of REQUESTS or triggered updates
	packets, it replies with the appropriate version. Be aware that the RIP network class
Version	configuration when RIPv1 is involved in the topology. RIPv1 uses classful routing, the subnet
	information is not included in the routing updates. The limitation makes it impossible to have
	different-sized subnets inside of the same network class. In other words, all subnets in a
	network class must have the same size
Update Timer	The timer interval (in seconds) between the router sends the complete routing table to all
Opuate Timer	neighboring RIP routers
Invalid Timer	The invalid timer is the number of seconds after which a route will be marked invalid.
Garbage-Collection	The garbage collection timer is the number of seconds after which a route will be deleted.
Timer	The garbage collection timer is the number of seconds after which a route will be deleted.
Next Update Time	Specifies when the next round of updates will be sent out from this router in seconds.
Redistribute Default	This indicates the default metric value of redistributed routes.
Metric	This indicates the default metric value of redistributed routes.
Redistribute	This indicates the connected route is redistributed or not.
Connected	This indicates the connected route is redistributed of not.
Redistribute Static	This indicates the static route is redistributed or not.
Redistribute OSPF	This indicates the OSPF route is redistributed or not.
Administrative	This indicates administrative distance value
Distance	

4.10.8.7 Interface Status

RIP Interface Status

Auto-refresh Refresh

Interface Send Version Receive Version Triggered Update Passive Auth. Type Key-Chain Name

No entry exists

Figure 4-10-8-7: RIP Interface Status

The following table explains the items shown on this page.

Object	Description
Interface	Interface identification.
Send Version	The RIP version for the advertisement transmission on the interface.
Receive Version	The RIP version for the advertisement reception on the interface.
Triggered Update	This indicates the interface enable triggered update or not.
Passive	This indicates if the passive-interface is active on the interface or not.
Key-Chain Name	This indicates the interface is associate with a specific key-chain name.

4.10.8.8 Peer Information

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from entry keys" input field allows the user to change the starting point in this table. Clicking the Refresh button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a Refresh button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

RIP Peer Information Start from Address 0.0.0.0 with 20 entries per page. 0 - 0 of 0 entry Auto-refresh Refresh Service Bad Packets Received Bad Routes No entry exists

Figure 4-10-8-8: RIP Peer Information

Object	Description
Gateway	Peer IPv4 address.
Version	The RIP version number in the header of the last RIP packet received from the neighbor.
Last Update Time	The time duration in seconds from the time the last RIP packet received from the neighbor to now.
Received Bad Packets	The number of RIP response packets from the neighbor discarded as invalid.
Received Bad Routes	The number of routes from the neighbor that were ignored because they were invalid.

4.10.8.9 Database

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from entry keys" input field allows the user to change the starting point in this table. Clicking the Refresh button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a Refresh button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

RIP Database Information

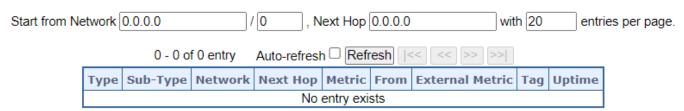

Figure 4-10-8-9: Database

Object	Description
Туре	The protocol type of the route.
Sub-Type	The protocol sub-type of the route.
Network	The destination IP address and mask of the route.
Next Hop	The first gateway along the route to the destination.
Metric	The metric of the route.
From	This indicates the route is learned an IP address or generated from one of the local interfaces.
External Metric	The field is significant only when the route is redistributed from other protocol type, for example, OSPF. This indicates the metric value from the original redistributed source.
Tag	The tag of the route. It is used to provide a method of separating 'internal' RIP routes, which may have been imported from an EGP (Exterior gateway protocol) or another IGP (Interior gateway protocol). For example, routes imported from OSPF can have a route tag value which the other routing protocols can use to prevent advertising the same route back to the original protocol routing domain.
Uptime	The time field is significant only when the route is learned from the neighbors. When the route destination is reachable (its metric value less than 16), the time field means the invalid time of the route. When the route destination is unreachable (its metric value great than 16), the time field means the garbage-collection time of the route.

4.10.9 Router (Only applies to switches installed with firmware after v1.2112bxxxxxx)

4.10.9.1 Key-Chain

This is router key chain name table. The maximum number of the router key-chain name entries is 64.

Router Key-Chain Configuration

Figure 4-10-9-1: Key-Chain Configuration

The following table explains the items shown on this page.

Object	Description
Delete	Check to delete the entry. It will be deleted during the next save.
Key-Chain Name	The name of the key-chain entry. The valid name string length is from 1 to 31 and allows all
	printable characters excluding space character.
Key ID	Click the icon to edit the key.

4.10.9.2 Key-Chain Key ID

Router Key-Chain Key IDs Configuration

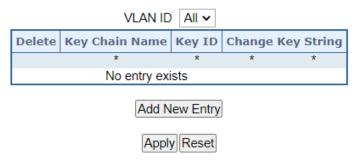

Figure 4-10-9-2: Key-Chain Key IDs Configuration

The following table explains the items shown on this page.

Object	Description
Delete	Check to delete the entry. It will be deleted during the next save.
Key-Chain Name	The name of the key-chain entry. The valid name string length is from 1 to 31 and allows all
	printable characters excluding space character.
Key ID	Click the icon to edit the key.
Change Key String	The key string. It is used to change the key string (fill with plain text). The valid string length is
	from 1 to 63.

4.10.9.3 Access List

This is router access-list configuration table. The maximum number of the router access-list entries is 130.

Router Access-List Configuration

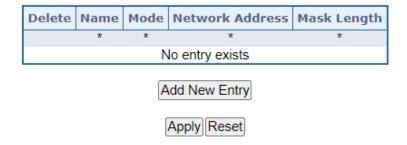

Figure 4-10-9-2: Router Access List Configuration

Object	Description
Delete	Check to delete the entry. It will be deleted during the next save.
Name	The name of the access-list entry. The valid name string length is from 1 to 31 and allows all
	printable characters excluding space character.
Mode	The access right mode of the access-list entry.
	Permit: Permit the access right.
	Deny: Deny the access right.
Network Address	The IPv4 address of the access-list entry.
Mask Length	The network prefix size of the access-list entry.

5. SWITCH OPERATION

5.1 Address Table

The **Industrial Managed Switch** is implemented with an address table. This address table is composed of many entries. Each entry is used to store the address information of some nodes in the network, including MAC address, port no, etc. This information comes from the learning process of **Industrial Managed Switch**.

5.2 Learning

When one packet comes in from any port, the **Industrial Managed Switch** will record the source address, port no., and the other related information in address table. This information will be used to decide either forwarding or filtering for future packets.

5.3 Forwarding & Filtering

When one packet comes from some port of the **Industrial Managed Switch**, it will also check the destination address besides the source address learning. The **Industrial Managed Switch** will look up the address-table for the destination address. If not found, this packet will be forwarded to all the other ports except the port, which this packet comes in. And these ports will transmit this packet to the network it connected. If found, and the destination address is located at a different port from this packet comes in, the **Industrial Managed Switch** will forward this packet to the port where this destination address is located according to the information from address table. But, if the destination address is located at the same port with this packet comes in, then this packet will be filtered, thereby increasing the network throughput and availability.

5.4 Store-and-Forward

Store-and-Forward is one type of packet-forwarding techniques. A Store-and-Forward **Industrial Managed Switch** stores the incoming frame in an internal buffer and do the complete error checking before transmission. Therefore, no error packets occur; it is the best choice when a network needs efficiency and stability.

The **Industrial Managed Switch** scans the destination address from the packet-header, searches the routing table provided for the incoming port and forwards the packet, only if required. The fast forwarding makes the switch attractive for connecting servers directly to the network, thereby increasing throughput and availability. However, the switch is most commonly used to segment existence hubs, which nearly always improves the overall performance. An Ethernet switching can be easily configured in any Ethernet network environment to significantly boost bandwidth using the conventional cabling and adapters.

Due to the learning function of the **Industrial Managed Switch**, the source address and corresponding port number of each incoming and outgoing packet are stored in a routing table. This information is subsequently used to filter packets whose destination address is in the same segment as the source address. This confines network traffic to its respective domain and reduce the overall load on the network.

The **Industrial Managed Switch** performs **"Store and Fforward"**; therefore, no error packets occur. More reliably, it reduces the re-transmission rate. No packet loss will occur.

5.5 Auto-Negotiation

The STP ports on the Switch have built-in "Auto-negotiation". This technology automatically sets the best possible bandwidth when a connection is established with another network device (usually at Power On or Reset). This is done by detecting the modes and speeds both connected devices are capable of. Both 10BASE-T and 100BASE-TX devices can connect with the port in either half- or full-duplex mode. 1000BASE-T can be only connected in full-duplex mode.

6. TROUBLESHOOTING

This chapter contains information to help you solve issues. If the **Industrial Managed Switch** is not functioning properly, make sure the **Industrial Managed Switch** was set up according to instructions in this manual.

■ The Link LED is not lit.

Solution: Check the cable connection and remove duplex mode of the Industrial Managed Switch.

Some stations cannot talk to other stations located on the other port.

Solution: Please check the VLAN settings, trunk settings, or port enabled/disabled status.

Performance is not as expected.

Solution: Check the full duplex status of the **Industrial Managed Switch**. If the **Industrial Managed Switch** is set to full duplex and the partner is set to half duplex, then the performance will be poor. Please also check the in/out rate of the port.

■ Why doesn't the Switch connect to the network?

Solution:

- 1. Check the LNK/ACT LED on the switch.
- 2. Try another port on the Switch.
- 3. Make sure the cable is installed properly.
- 4. Make sure the cable is the right type.
- 5. Turn off the power. After a while, turn on power again.

■ 1000BASE-T port link LED is lit, but the traffic is irregular.

Solution: Check that the attached device is not set to dedicate full duplex. Some devices use a physical or software switch to change duplex modes. Auto-negotiation may not recognize this type of full-duplex setting.

Switch does not power up.

Solution:

- 1. DC wire or AC power cord is not inserted or faulty.
- 2. Check that the DC wire/AC power cord is inserted correctly.
- 3. Replace the DC wire/AC power cord if the cord is inserted correctly; check that the DC/AC power source is working by connecting a different device in place of the switch.
- 4. If that device works, refer to the next step.
- 5. If that device does not work, check the DC/AC power.

APPENDIX A: Networking Connection

A.1 Switch's Data RJ45 Pin Assignments - 1000Mbps, 1000BASE-T

PIN NO	MDI	MDI-X
1	BI_DA+	BI_DB+
2	BI_DA-	BI_DB-
3	BI_DB+	BI_DA+
4	BI_DC+	BI_DD+
5	BI_DC-	BI_DD-
6	BI_DB-	BI_DA-
7	BI_DD+	BI_DC+
8	BI_DD-	BI_DC-

Implicit implementation of the crossover function within a twisted-pair cable, or at a wiring panel, while not expressly forbidden, is beyond the scope of this standard.

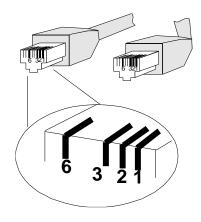

A.2 10/100Mbps, 10/100BASE-TX

When connecting your Switch to another Fast Ethernet switch, a bridge or a hub, a straight or crossover cable is necessary. Each port of the Switch supports auto-MDI/MDI-X detection. That means you can directly connect the Switch to any Ethernet devices without making a crossover cable. The following table and diagram show the standard RJ45 receptacle/ connector and their pin assignments:

RJ45 Connector pin assignment				
PIN NO	MDI	MDI-X		
	Media Dependent Interface	Media Dependent Interface-Cross		
1	Tx + (transmit)	Rx + (receive)		
2	Tx - (transmit)	Rx - (receive)		
3	Rx + (receive)	Tx + (transmit)		
4, 5	Not used			
6	Rx - (receive)	Tx - (transmit)		
7, 8		Not used		

The standard cable, RJ45 pin assignment

The standard RJ45 receptacle/connector

There are 8 wires on a standard UTP/STP cable and each wire is color-coded. The following shows the pin allocation and color of straight-through cable and crossover cable connection:

Straight Cable		SIDE 1	SIDE 2
1 2 3 4 5 6 7 8	SIDE 1	1 = White / Orange	1 = White / Orange
$ \begin{array}{c ccccccccccccccccccccccccccccccccccc$		2 = Orange	2 = Orange
		3 = White / Green	3 = White / Green
		4 = Blue	4 = Blue
		5 = White / Blue	5 = White / Blue
		6 = Green	6 = Green
		7 = White / Brown	7 = White / Brown
		8 = Brown	8 = Brown
	SIDE 2		
Crossover Cable		SIDE 1	SIDE 2
4 0 0 4 5 0 7 0	SIDE 1	1 = White / Orange	1 = White / Green
$\frac{1}{1} \stackrel{2}{\sim} \frac{3}{1} \stackrel{4}{+} \frac{5}{+} \stackrel{6}{\sim} \frac{7}{1} \stackrel{8}{+}$		2 = Orange	2 = Green
		3 = White / Green	3 = White / Orange
		4 = Blue	4 = Blue
		5 = White / Blue	5 = White / Blue
		6 = Green	6 = Orange
		7 = White / Brown	7 = White / Brown
$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	SIDE 2	8 = Brown	8 = Brown

Figure A-1: Straight-through and Crossover Cable

Please make sure your connected cables are with the same pin assignment and color as the above picture before deploying the cables into your network

APPENDIX B : GLOSSARY

Α

ACE

ACE is an acronym for Access Control Entry. It describes access permission associated with a particular ACE ID.

There are three ACE frame types (Ethernet Type, ARP, and IPv4) and two ACE actions (permit and deny). The ACE also contains many detailed, different parameter options that are available for individual application.

ACL

ACL is an acronym for <u>Access <u>Control List</u>. It is the list table of ACEs, containing access control entries that specify individual users or groups permitted or denied to specific traffic objects, such as a process or a program.</u>

Each accessible traffic object contains an identifier to its ACL. The privileges determine whether there are specific traffic object access rights.

ACL implementations can be quite complex, for example, when the ACEs are prioritized for the various situation. In networking, the ACL refers to a list of service ports or network services that are available on a host or server, each with a list of hosts or servers permitted or denied to use the service. ACL can generally be configured to control inbound traffic, and in this context, they are similar to firewalls.

There are 3 web pages associated with the manual ACL configuration:

ACL|Access Control List: The web page shows the ACEs in a prioritized way, highest (top) to lowest (bottom). Default the table is empty. An ingress frame will only get a hit on one ACE even though there are more matching ACEs. The first matching ACE will take action (permit/deny) on that frame and a counter associated with that ACE is incremented. An ACE can be associated with a policy, 1 ingress port, or any ingress port (the whole switch). If an ACE Policy is created then that policy can be associated with a group of ports under the "Ports" web page. There are number of parameters that can be configured with an ACE. Read the web page help text to get further information for each of them. The maximum number of ACEs is 64.

ACL|Ports: The ACL Port configuration is used to assign a Policy ID to an ingress port. This is useful to group ports to obey the same traffic rules. Traffic Policy is created under the "Access Control List". You can you also set up specific traffic properties (Action / Rate Limiter / Port copy, etc) for each ingress port. They will though only apply if the frame gets past the ACE matching without getting matched. In that case a counter associated with that port is incremented. See the web page help text for each specific port property.

ACL|Rate Limiters: On this page, you can configure the rate limiters. There can be 15 different rate limiters, each ranging from 1 to 1024K packets per second. Under "Ports" and "Access Control List", you can assign a Rate Limiter ID to the ACE(s) or ingress port(s).

AES

AES is an acronym for Advanced Encryption Standard. The encryption key protocol is applied in 802.1x standard to improve WLAN security. It is an encryption standard by the U.S. government, which will replace DES and 3DES. AES has a fixed block size of 128 bits and a key size of 128, 192, or 256 bits.

AMS

AMS is an acronym for <u>Auto Media Select</u>. AMS is used for dual media ports (ports supporting both copper (cu) and fiber (SFP) cables. AMS automatically determines if an SFP or a CU cable is inserted and switches to the corresponding media. If both SFP and cu cables are inserted, the port will select the prefered media.

APS

APS is an acronym for <u>A</u>utomatic <u>P</u>rotection <u>S</u>witching. This protocol is used to secure switching that is done bidirectional in both ends of a protection group, as defined in G.8031.

Aggregation

Using multiple ports in parallel to increase the link speed beyond the limits of a port and to increase the redundancy for higher availability.

(Also Port Aggregation, Link Aggregation).

ARP

ARP is an acronym for <u>A</u>ddress <u>R</u>esolution <u>P</u>rotocol. It is a protocol that used to convert an IP address into a physical address, such as an Ethernet address. ARP allows a host to communicate with other hosts when only the Internet address of its neighbors is known. Before using IP, the host sends a broadcast ARP request containing the Internet address of the desired destination system.

ARP Inspection

ARP Inspection is a secure feature. Several types of attacks can be launched against a host or devices connected to Layer 2 networks by "poisoning" the ARP caches. This feature is used to block such attacks. Only valid ARP requests and responses can go through the switch device.

Auto-Negotiation

Auto-negotiation is the process where two different devices establish the mode of operation and the speed settings that can be shared by those devices for a link.

C

CC

CC is an acronym for **C**ontinuity **C**heck. It is a MEP functionality that is able to detect loss of continuity in a network by transmitting CCM frames to a peer MEP.

CCM

CCM is an acronym for $\underline{\mathbf{C}}$ ontinuity $\underline{\mathbf{C}}$ heck $\underline{\mathbf{M}}$ essage. It is a OAM frame transmitted from a MEP to its peer MEP and used to implement CC functionality.

CDP

CDP is an acronym for **C**isco **D**iscovery **P**rotocol.

D

DEI

DEI is an acronym for **D**rop **E**ligible **I**ndicator. It is a 1-bit field in the VLAN tag.

DES

DES is an acronym for <u>D</u>ata <u>Encryption</u> <u>S</u>tandard. It provides a complete description of a mathematical algorithm for encrypting (enciphering) and decrypting (deciphering) binary coded information.

Encrypting data converts it to an unintelligible form called cipher. Decrypting cipher converts the data back to its original form called plaintext. The algorithm described in this standard specifies both enciphering and deciphering operations which are based on a binary number called a key.

DHCP

DHCP is an acronym for $\underline{\mathbf{D}}$ ynamic $\underline{\mathbf{H}}$ ost $\underline{\mathbf{C}}$ on figuration $\underline{\mathbf{P}}$ rotocol. It is a protocol used for assigning dynamic IP addresses to devices on a network.

DHCP used by networked computers (clients) to obtain IP addresses and other parameters such as the default gateway, subnet mask, and IP addresses of DNS servers from a DHCP server.

The DHCP server ensures that all IP addresses are unique, for example, no IP address is assigned to a second client while the first client's assignment is valid (its lease has not expired). Therefore, IP address pool management is done by the server and not by a human network administrator.

Dynamic addressing simplifies network administration because the software keeps track of IP addresses rather than requiring an administrator to manage the task. This means that a new computer can be added to a network without the hassle of manually assigning it a unique IP address.

DHCP Relay

DHCP Relay is used to forward and to transfer DHCP messages between the clients and the server when they are not on the same subnet domain.

The DHCP option 82 enables a DHCP relay agent to insert specific information into a DHCP request packets when forwarding client DHCP packets to a DHCP server and remove the specific information from a DHCP reply packets when forwarding server DHCP packets to a DHCP client. The DHCP server can use this information to implement IP address or other assignment policies. Specifically the option works by setting two sub-options: Circuit ID (option 1) and Remote ID (option2). The Circuit ID sub-option is supposed to include information specific to which circuit the request came in on. The Remote ID sub-option was designed to carry information relating to the remote host end of the circuit.

The definition of Circuit ID in the switch is 4 bytes in length and the format is "vlan_id" "module_id" "port_no". The parameter of "vlan_id" is the first two bytes represent the VLAN ID. The parameter of "module_id" is the third byte for the module ID. The parameter of "port_no" is the fourth byte and it means the port number. The Remote ID is 6 bytes in length, and the value is equal the DHCP relay agents MAC address.

DHCP Snooping

DHCP Snooping is used to block intruder on the untrusted ports of the switch device when it tries to intervene by injecting a bogus DHCP reply packet to a legitimate conversation between the DHCP client and server.

DNS

DNS is an acronym for <u>D</u>omain <u>N</u>ame <u>S</u>ystem. It stores and associates many types of information with domain names. Most importantly, DNS translates human-friendly domain names and computer hostnames into computer-friendly IP addresses. For example, the domain name www.example.com might translate to 192.168.0.1.

DoS

DoS is an acronym for <u>D</u>enial of <u>S</u>ervice. In a denial-of-service (DoS) attack, an attacker attempts to prevent legitimate users from accessing information or services. By targeting at network sites or network connection, an attacker may be able to prevent network users from accessing email, web sites, online accounts (banking, etc.), or other services that rely on the affected computer.

Dotted Decimal Notation

Dotted Decimal Notation refers to a method of writing IP addresses using decimal numbers and dots as separators between octets.

An IPv4 dotted decimal address has the form x.y.z.w, where x, y, z, and w are decimal numbers between 0 and 255.

DSCP

DSCP is an acronym for $\underline{\mathbf{D}}$ ifferentiated $\underline{\mathbf{S}}$ ervices $\underline{\mathbf{C}}$ ode $\underline{\mathbf{P}}$ oint. It is a field in the header of IP packets for packet classification purposes.

E

EEE

EEE is an abbreviation for Energy Efficient Ethernet defined in IEEE 802.3az.

EPS

EPS is an abbreviation for Ethernet Protection Switching defined in ITU/T G.8031.

Ethernet Type

Ethernet Type, or EtherType, is a field in the Ethernet MAC header, defined by the Ethernet networking standard. It is used to indicate which protocol is being transported in an Ethernet frame.

F

FTP

FTP is an acronym for <u>File Transfer Protocol</u>. It is a transfer protocol that uses the Transmission Control Protocol (TCP) and provides file writing and reading. It also provides directory service and security features.

Fast Leave

IGMP snooping Fast Leave processing allows the switch to remove an interface from the forwarding-table entry without first sending out group specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Fast-leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are in use simultaneously.

Н

HTTP

HTTP is an acronym for <u>H</u>ypertext <u>T</u>ransfer <u>P</u>rotocol. It is a protocol that used to transfer or convey information on the World Wide Web (WWW).

HTTP defines how messages are formatted and transmitted, and what actions Web servers and browsers should take in response to various commands. For example, when you enter a URL in your browser, this actually sends an HTTP command to the Web server directing it to fetch and transmit the requested web page. The other main standard that controls how the World Wide Web works is HTML, which covers how web pages are formatted and displayed.

Any Web server machine contains, in addition to the web page files it can serve, an HTTP daemon, a program that is designed to wait for HTTP requests and handle them when they arrive. The Web browser is an HTTP client, sending requests to server machines. An HTTP client initiates a request by establishing a Transmission Control Protocol (TCP) connection to a particular port on a remote host (port 80 by default). An HTTP server listening on that port waits for the client to send a request message.

HTTPS

HTTPS is an acronym for $\underline{\mathbf{H}}$ ypertext $\underline{\mathbf{T}}$ ransfer $\underline{\mathbf{P}}$ rotocol over $\underline{\mathbf{S}}$ ecure Socket Layer. It is used to indicate a secure HTTP connection.

HTTPS provide authentication and encrypted communication and is widely used on the World Wide Web for security-sensitive communication such as payment transactions and corporate logons.

HTTPS is really just the use of Netscape's Secure Socket Layer (SSL) as a sublayer under its regular HTTP application layering. (HTTPS uses port 443 instead of HTTP port 80 in its interactions with the lower layer, TCP/IP.) SSL uses a 40-bit key size for the RC4 stream encryption algorithm, which is considered an adequate degree of encryption for commercial exchange.

ı

ICMP

ICMP is an acronym for Internet Control Message Protocol. It is a protocol that generated the error response, diagnostic or routing purposes. ICMP messages generally contain information about routing difficulties or simple exchanges such as time-stamp or echo transactions. For example, the PING command uses ICMP to test an Internet connection.

IEEE 802.1X

IEEE 802.1X is an IEEE standard for port-based Network Access Control. It provides authentication to devices attached to a LAN port, establishing a point-to-point connection or preventing access from that port if authentication fails. With 802.1X, access to all switch ports can be centrally controlled from a server, which means that authorized users can use the same credentials for authentication from any point within the network.

IGMP

IGMP is an acronym for Internet Group Management Protocol. It is a communications protocol used to manage the membership of Internet Protocol multicast groups. IGMP is used by IP hosts and adjacent multicast routers to establish multicast group memberships. It is an integral part of the IP multicast specification, like ICMP for unicast connections. IGMP can be used for online video and gaming, and allows more efficient use of resources when supporting these uses.

IGMP Querier

A router sends IGMP Query messages onto a particular link. This router is called the Querier.

IMAP

IMAP is an acronym for Internet $\underline{\mathbf{M}}$ essage $\underline{\mathbf{A}}$ ccess $\underline{\mathbf{P}}$ rotocol. It is a protocol for email clients to retrieve email messages from a mail server.

IMAP is the protocol that IMAP clients use to communicate with the servers, and SMTP is the protocol used to transport mail to an IMAP server.

The current version of the Internet Message Access Protocol is IMAP4. It is similar to Post Office Protocol version 3 (POP3), but offers additional and more complex features. For example, the IMAP4 protocol leaves your email messages on the server rather than downloading them to your computer. If you wish to remove your messages from the server, you must use your mail client to generate local folders, copy messages to your local hard drive, and then delete and expunge the messages from the server.

IP

IP is an acronym for Internet Protocol. It is a protocol used for communicating data across a internet network.

IP is a "best effort" system, which means that no packet of information sent over it is assured to reach its destination in the same condition it was sent. Each device connected to a Local Area Network (LAN) or Wide Area Network (WAN) is given an Internet Protocol address, and this IP address is used to identify the device uniquely among all other devices connected to the extended network.

The current version of the Internet protocol is IPv4, which has 32-bits Internet Protocol addresses allowing for in excess of four billion unique addresses. This number is reduced drastically by the practice of webmasters taking addresses in large blocks, the bulk of which remain unused. There is a rather substantial movement to adopt a new version of the Internet Protocol, IPv6, which would have 128-bits Internet Protocol addresses. This number can be represented roughly by a three with thirty-nine zeroes after it. However, IPv4 is still the protocol of choice for most of the Internet.

IPMC

IPMC is an acronym for IP MultiCast.

IP Source Guard

IP Source Guard is a secure feature used to restrict IP traffic on DHCP snooping untrusted ports by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host.

LACP

LACP is an IEEE 802.3ad standard protocol. The <u>Link Aggregation Control Protocol allows bundling several physical ports together to form a single logical port.</u>

LLDP

LLDP is an IEEE 802.1ab standard protocol.

The Link Layer Discovery Protocol(LLDP) specified in this standard allows stations attached to an IEEE 802 LAN to advertise, to other stations attached to the same IEEE 802 LAN, the major capabilities provided by the system incorporating that station, the management address or addresses of the entity or entities that provide management of those capabilities, and the identification of the stations point of attachment to the IEEE 802 LAN required by those management entities. The information distributed via this protocol is stored by its recipients in a standard Management Information Base (MIB), making it possible for the information to be accessed by a Network Management System (NMS) using a management protocol such as the Simple Network Management Protocol (SNMP).

LLDP-MED

LLDP-MED is an extension of IEEE 802.1ab and is defined by the telecommunication industry association (TIA-1057).

LOC

LOC is an acronym for <u>L</u>oss <u>Of Connectivity</u> and is detected by a MEP and is indicating lost connectivity in the network. Can be used as a switch criteria by EPS

M

MAC Table

Switching of frames is based upon the DMAC address contained in the frame. The switch builds up a table that maps MAC addresses to switch ports for knowing which ports the frames should go to (based upon the DMAC address in the frame). This table contains both static and dynamic entries. The static entries are configured by the network administrator if the administrator wants to do a fixed mapping between the DMAC address and switch ports.

The frames also contain a MAC address (SMAC address), which shows the MAC address of the equipment sending the frame. The SMAC address is used by the switch to automatically update the MAC table with these dynamic MAC addresses. Dynamic entries are removed from the MAC table if no frame with the corresponding SMAC address have been seen after a configurable age time.

MEP

MEP is an acronym for <u>Maintenance</u> <u>Entity</u> <u>Endpoint and is an endpoint in a Maintenance Entity Group (ITU-TY.1731).</u>

MD5

MD5 is an acronym for <u>Message-Digest algorithm</u> <u>5</u>. MD5 is a message digest algorithm, used cryptographic hash function with a 128-bit hash value. It was designed by Ron Rivest in 1991. MD5 is officially defined in RFC 1321 - The MD5 Message-Digest Algorithm.

Mirroring

For debugging network problems or monitoring network traffic, the switch system can be configured to mirror frames from multiple ports to a mirror port. (In this context, mirroring a frame is the same as copying the frame.)

Both incoming (source) and outgoing (destination) frames can be mirrored to the mirror port.

MLD

MLD is an acronym for <u>M</u>ulticast <u>L</u>istener <u>D</u>iscovery for IPv6. MLD is used by IPv6 routers to discover multicast listeners on a directly attached link, much as IGMP is used in IPv4. The protocol is embedded in ICMPv6 instead of using a separate protocol.

MVR

Multicast VLAN Registration (MVR) is a protocol for Layer 2 (IP)-networks that enables multicast-traffic from a source VLAN to be shared with subscriber-VLANs. The main reason for using MVR is to save bandwidth by preventing duplicate multicast streams being sent in the core network, instead the stream(s) are received on the MVR-VLAN and forwarded to the VLANs where hosts have requested it/them (Wikipedia).

N

NAS

NAS is an acronym for Network Access Server. The NAS is meant to act as a gateway to guard access to a protected source. A client connects to the NAS, and the NAS connects to another resource asking whether the client's supplied credentials are valid. Based on the answer, the NAS then allows or disallows access to the protected resource. An example of a NAS implementation is IEEE 802.1X.

NetBIOS

NetBIOS is an acronym for <u>Net</u>work <u>B</u>asic <u>Input/Output System</u>. It is a program that allows applications on separate computers to communicate within a Local Area Network (LAN), and it is not supported on a Wide Area Network (WAN).

The NetBIOS giving each computer in the network both a NetBIOS name and an IP address corresponding to a different host name, provides the session and transport services described in the Open Systems Interconnection (OSI) model.

NFS

NFS is an acronym for $\underline{\mathbf{N}}$ etwork $\underline{\mathbf{F}}$ ile $\underline{\mathbf{S}}$ ystem. It allows hosts to mount partitions on a remote system and use them as though they are local file systems.

NFS allows the system administrator to store resources in a central location on the network, providing authorized users continuous access to them, which means NFS supports sharing of files, printers, and other resources as persistent storage over a computer network.

NTP

NTP is an acronym for <u>Network Time Protocol</u>, a network protocol for synchronizing the clocks of computer systems. NTP uses UDP (datagrams) as transport layer.

0

OAM

OAM is an acronym for **O**peration **A**dministration and **M**aintenance. It is a protocol described in ITU-T Y.1731 used to implement carrier Ethernet functionality. MEP functionality like CC and RDI is based on this.

Optional TLVs.

An LLDP frame contains multiple TLVs. For some TLVs it is configurable if the switch includes the TLV in the LLDP frame. These TLVs are known as optional TLVs. If an optional TLV is disabled the corresponding information is not included in the LLDP frame.

OUI

OUI is the organizationally unique identifier. An OUI address is a globally unique identifier assigned to a vendor by IEEE. You can determine which vendor a device belongs to according to the OUI address which forms the first 24 bits of an MAC address.

P

PCP

PCP is an acronym for Priority Code Point. It is a 3-bit field storing the priority level for the 802.1Q frame. It is also known as User Priority.

PD

PD is an acronym for <u>P</u>owered <u>D</u>evice. In a PoE> system the power is delivered from a PSE (power sourcing equipment) to a remote device. The remote device is called a PD.

PHY

PHY is an abbreviation for Physical Interface Transceiver and is the device that implement the Ethernet physical layer (IEEE-802.3).

PING

Ping is a program that sends a series of packets over a network or the Internet to a specific computer in order to generate a response from that computer. The other computer responds with an acknowledgment that it received the packets. Ping was created to verify whether a specific computer on a network or the Internet exists and is connected.

Ping uses Internet Control Message Protocol (ICMP) packets. The Ping Request is the packet from the origin computer, and the Ping Reply is the packet response from the target.

Policer

A policer can limit the bandwidth of received frames. It is located in front of the ingress queue.

POP3

POP3 is an acronym for **P**ost **O**ffice **P**rotocol version 3. It is a protocol for email clients to retrieve email messages from a mail server.

POP3 is designed to delete mail on the server as soon as the user has downloaded it. However, some implementations allow users or an administrator to specify that mail be saved for some period of time. POP can be thought of as a "store-and-forward" service.

An alternative protocol is Internet Message Access Protocol (IMAP). IMAP provides the user with more capabilities for retaining e-mail on the server and for organizing it in folders on the server. IMAP can be thought of as a remote file server.

POP and IMAP deal with the receiving of e-mail and are not to be confused with the Simple Mail Transfer Protocol (SMTP). You send e-mail with SMTP, and a mail handler receives it on your recipient's behalf. Then the mail is read using POP or IMAP. IMAP4 and POP3 are the two most prevalent Internet standard protocols for e-mail retrieval. Virtually all modern e-mail clients and servers support both.

PPPoE

PPPoE is an acronym for Point-to-Point Protocol over Ethernet. It is a network protocol for encapsulating Point-to-Point Protocol (PPP) frames inside Ethernet frames. It is used mainly with ADSL services where individual users connect to the ADSL transceiver (modem) over Ethernet and in plain Metro Ethernet networks (Wikipedia).

Private VLAN

In a private VLAN, communication between ports in that private VLAN is not permitted. A VLAN can be configured as a private VLAN.

PTP

PTP is an acronym for Precision Time Protocol, a network protocol for synchronizing the clocks of computer systems.

Q

QCE

QCE is an acronym for $\underline{\mathbf{Q}}$ oS $\underline{\mathbf{C}}$ ontrol $\underline{\mathbf{E}}$ ntry. It describes QoS class associated with a particular QCE ID.

There are six QCE frame types: Ethernet Type, VLAN, UDP/TCP Port, DSCP, TOS, and Tag Priority. Frames can be classified by one of 4 different QoS classes: "Low", "Normal", "Medium", and "High" for individual application.

QCL

QCL is an acronym for **Q**oS **C**ontrol **L**ist. It is the list table of QCEs, containing QoS control entries that classify to a specific QoS class on specific traffic objects.

Each accessible traffic object contains an identifier to its QCL. The privileges determine specific traffic object to specific QoS class.

QL

QL In SyncE this is the Quality Level of a given clock source. This is received on a port in a SSM indicating the quality of the clock received in the port.

QoS

QoS is an acronym for $\underline{\mathbf{Q}}$ uality $\underline{\mathbf{o}}$ f $\underline{\mathbf{S}}$ ervice. It is a method to guarantee a bandwidth relationship between individual applications or protocols.

A communications network transports a multitude of applications and data, including high-quality video and delay-sensitive data such as real-time voice. Networks must provide secure, predictable, measurable, and sometimes guaranteed services.

Achieving the required QoS becomes the secret to a successful end-to-end business solution. Therefore, QoS is the set of techniques to manage network resources.

QoS class

Every incoming frame is classified to a QoS class, which is used throughout the device for providing queuing, scheduling and congestion control guarantees to the frame according to what was configured for that specific QoS class. There is a one to one mapping between QoS class, queue and priority. A QoS class of 0 (zero) has the lowest priority.

R

RARP

RARP is an acronym for **R**everse **A**ddress **R**esolution **P**rotocol. It is a protocol that is used to obtain an IP address for a given hardware address, such as an Ethernet address. RARP is the complement of ARP.

RADIUS

RADIUS is an acronym for **Re**mote **A**uthentication **D**ial In **U**ser **S**ervice. It is a networking protocol that provides centralized access, authorization and accounting management for people or computers to connect and use a network service.

RDI

RDI is an acronym for **R**emote **D**efect **I**ndication. It is an OAM functionality that is used by a MEP to indicate defect detected to the remote peer MEP

Router Port

A router port is a port on the Ethernet switch that leads switch towards the Layer 3 multicast device.

RSTP

In 1998, the IEEE with document 802.1w introduced an evolution of STP: the **R**apid **S**panning **T**ree **P**rotocol, which provides for faster spanning tree convergence after a topology change. Standard IEEE 802.1D-2004 now incorporates RSTP and obsoletes STP, while at the same time being backwards-compatible with STP.

S

SAMBA

Samba is a program running under UNIX-like operating systems that provides seamless integration between UNIX and Microsoft Windows machines. Samba acts as file and print servers for Microsoft Windows, IBM OS/2, and other SMB client machines. Samba uses the Server Message Block (SMB) protocol and Common Internet File System (CIFS), which is the underlying protocol used in Microsoft Windows networking.

Samba can be installed on a variety of operating system platforms, including Linux, most common Unix platforms, OpenVMS, and IBM OS/2.

Samba can also register itself with the master browser on the network so that it would appear in the listing of hosts in Microsoft Windows "Neighborhood Network".

SHA

SHA is an acronym for **S**ecure **H**ash **A**lgorithm. It designed by the National Security Agency (NSA) and published by the NIST as a U.S. Federal Information Processing Standard. Hash algorithms compute a fixed-length digital representation (known as a message digest) of an input data sequence (the message) of any length.

Shaper

A shaper can limit the bandwidth of transmitted frames. It is located after the ingress queues.

SMTP

SMTP is an acronym for **S**imple **M**ail **T**ransfer **P**rotocol. It is a text-based protocol that uses the Transmission Control Protocol (TCP) and provides a mail service modeled on the FTP file transfer service. SMTP transfers mail messages between systems and notifications regarding incoming mail.

SNAP

The SubNetwork Access Protocol (SNAP) is a mechanism for multiplexing, on networks using IEEE 802.2 LLC, more protocols than can be distinguished by the 8-bit 802.2 Service Access Point (SAP) fields. SNAP supports identifying protocols by Ethernet type field values; it also supports vendor-private protocol identifier.

SNMP

SNMP is an acronym for **S**imple **N**etwork **M**anagement **P**rotocol. It is part of the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol for network management. SNMP allow diverse network objects to participate in a network management architecture. It enables network management systems to learn network problems by receiving traps or change notices from network devices implementing SNMP.

SNTP

SNTP is an acronym for <u>Simple Network Time Protocol</u>, a network protocol for synchronizing the clocks of computer systems. SNTP uses UDP (datagrams) as transport layer.

SPROUT

Stack **P**rotocol using **ROU**ting **T**echnology. An advanced protocol for almost instantaneous discovery of topology changes within a stack as well as election of a master switch. SPROUT also calculates parameters for setting up each switch to perform shortest path forwarding within the stack.

SSID

<u>Service</u> <u>Set</u> <u>Identifier</u> is a name used to identify the particular 802.11 wireless LANs to which a user wants to attach. A client device will receive broadcast messages from all access points within range advertising their SSIDs, and can choose one to connect to based on pre-configuration, or by displaying a list of SSIDs in range and asking the user to select one (wikipedia).

SSH

SSH is an acronym for <u>Secure SHell</u>. It is a network protocol that allows data to be exchanged using a secure channel between two networked devices. The encryption used by SSH provides confidentiality and integrity of data over an insecure network. The goal of SSH was to replace the earlier rlogin, TELNET and rsh protocols, which did not provide strong authentication or guarantee confidentiality (Wikipedia).

SSM

SSM In SyncE this is an abbreviation for Synchronization Status Message and is containing a QL indication.

STP

Spanning **T**ree **P**rotocol is an OSI layer-2 protocol which ensures a loop free topology for any bridged LAN. The original STP protocol is now obsolete by RSTP.

SyncE

SyncE Is an abbreviation for Synchronous Ethernet. This functionality is used to make a network 'clock frequency' synchronized. Not to be confused with real time clock synchronized (IEEE 1588).

Т

TACACS+

TACACS+ is an acronym for <u>Terminal Access Controller Access Control System Plus</u>. It is a networking protocol which provides access control for routers, network access servers and other networked computing devices via one or more centralized servers. TACACS+ provides separate authentication, authorization and accounting services.

Tag Priority

Tag Priority is a 3-bit field storing the priority level for the 802.1Q frame.

TCP

TCP is an acronym for $\underline{\mathbf{T}}$ ransmission $\underline{\mathbf{C}}$ ontrol $\underline{\mathbf{P}}$ rotocol. It is a communications protocol that uses the Internet Protocol (IP) to exchange the messages between computers.

The TCP protocol guarantees reliable and in-order delivery of data from sender to receiver and distinguishes data for multiple connections by concurrent applications (for example, Web server and e-mail server) running on the same host.

The applications on networked hosts can use TCP to create connections to one another. It is known as a connection-oriented protocol, which means that a connection is established and maintained until such time as the message or messages to be exchanged by the application programs at each end have been exchanged. TCP is responsible for ensuring that a message is divided into the packets that IP manages and for reassembling the packets back into the complete message at the other end.

Common network applications that use TCP include the World Wide Web (WWW), e-mail, and File Transfer Protocol (FTP).

TELNET

TELNET is an acronym for <u>Tel</u>etype <u>Net</u>work. It is a terminal emulation protocol that uses the Transmission Control Protocol (TCP) and provides a virtual connection between TELNET server and TELNET client.

TELNET enables the client to control the server and communicate with other servers on the network. To start a Telnet session, the client user must log in to a server by entering a valid username and password. Then, the client user can enter commands through the Telnet program just as if they were entering commands directly on the server console.

TFTP

TFTP is an acronym for <u>Trivial File Transfer Protocol</u>. It is transfer protocol that uses the User Datagram Protocol (UDP) and provides file writing and reading, but it does not provides directory service and security features.

Toss

Toss is an acronym for <u>Type of Service</u>. It is implemented as the IPv4 Toss priority control. It is fully decoded to determine the priority from the 6-bit Toss field in the IP header. The most significant 6 bits of the Toss field are fully decoded into 64 possibilities, and the singular code that results is compared against the corresponding bit in the IPv4 ToS priority control bit (0~63).

TLV

TLV is an acronym for $\underline{\mathbf{T}}$ ype $\underline{\mathbf{L}}$ ength $\underline{\mathbf{V}}$ alue. A LLDP frame can contain multiple pieces of information. Each of these pieces of information is known as TLV.

TKIP

TKIP is an acronym for <u>Temporal Key Integrity Protocol</u>. It used in WPA to replace WEP with a new encryption algorithm. TKIP comprises the same encryption engine and RC4 algorithm defined for WEP. The key used for encryption in TKIP is 128 bits and changes the key used for each packet.

U

UDP

UDP is an acronym for $\underline{\mathbf{U}}$ ser $\underline{\mathbf{D}}$ atagram $\underline{\mathbf{P}}$ rotocol. It is a communications protocol that uses the Internet Protocol (IP) to exchange the messages between computers.

UDP is an alternative to the Transmission Control Protocol (TCP) that uses the Internet Protocol (IP). Unlike TCP, UDP does not provide the service of dividing a message into packet datagrams, and UDP doesn't provide reassembling and sequencing of the packets. This means that the application program that uses UDP must be able to make sure that the entire message has arrived and is in the right order. Network applications that want to save processing time because they have very small data units to exchange may prefer UDP to TCP.

UDP provides two services not provided by the IP layer. It provides port numbers to help distinguish different user requests and, optionally, a checksum capability to verify that the data arrived intact.

Common network applications that use UDP include the Domain Name System (DNS), streaming media applications such as IPTV, Voice over IP (VoIP), and Trivial File Transfer Protocol (TFTP).

UPnP

UPnP is an acronym for <u>U</u>niversal <u>P</u>lug and <u>P</u>lay. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components

User Priority

User Priority is a 3-bit field storing the priority level for the 802.1Q frame.

VLAN

A method to restrict communication between switch ports. VLANs can be used for the following applications:

VLAN unaware switching: This is the default configuration. All ports are VLAN unaware with Port VLAN ID 1 and members of VLAN 1. This means that MAC addresses are learned in VLAN 1, and the switch does not remove or insert VLAN tags.

VLAN aware switching: This is based on the IEEE 802.1Q standard. All ports are VLAN aware. Ports connected to VLAN aware switches are members of multiple VLANs and transmit tagged frames. Other ports are members of one VLAN, set up with this Port VLAN ID, and transmit untagged frames.

Provider switching: This is also known as Q-in-Q switching. Ports connected to subscribers are VLAN unaware, members of one VLAN, and set up with this unique Port VLAN ID. Ports connected to the service provider are VLAN aware, members of multiple VLANs, and set up to tag all frames. Untagged frames received on a subscriber port are forwarded to the provider port with a single VLAN tag. Tagged frames received on a subscriber port are forwarded to the provider port with a double VLAN tag.

VLAN ID

VLAN ID is a 12-bit field specifying the VLAN to which the frame belongs.

Voice VLAN

Voice VLAN is VLAN configured specially for voice traffic. By adding the ports with voice devices attached to voice VLAN, we can perform QoS-related configuration for voice data, ensuring the transmission priority of voice traffic and voice quality.

WEP

WEP is an acronym for <u>Wired Equivalent Privacy</u>. WEP is a deprecated algorithm to secure IEEE 802.11 wireless networks. Wireless networks broadcast messages using radio, so are more susceptible to eavesdropping than wired networks. When introduced in 1999, WEP was intended to provide confidentiality comparable to that of a traditional wired network (Wikipedia).

Wi-Fi

Wi-Fi is an acronym for <u>Wi</u>reless <u>Fi</u>delity. It is meant to be used generically when referring of any type of 802.11 network, whether 802.11b, 802.11a, dual-band, etc. The term is promulgated by the Wi-Fi Alliance.

WPA

WPA is an acronym for <u>W</u>i-Fi <u>P</u>rotected <u>A</u>ccess. It was created in response to several serious weaknesses researchers had found in the previous system, Wired Equivalent Privacy (WEP). WPA implements the majority of the IEEE 802.11i standard, and was intended as an intermediate measure to take the place of WEP while 802.11i was prepared. WPA is specifically designed to also work with pre-WPA wireless network interface cards (through firmware upgrades), but not necessarily with first generation wireless access points. WPA2 implements the full standard, but will not work with some older network cards (Wikipedia).

WPA-PSK

WPA-PSK is an acronym for <u>W</u>i-Fi <u>P</u>rotected <u>A</u>ccess - <u>P</u>re <u>S</u>hared <u>K</u>ey. WPA was designed to enhance the security of wireless networks. There are two flavors of WPA: enterprise and personal. Enterprise is meant for use with an IEEE 802.1X authentication server, which distributes different keys to each user. Personal WPA utilizes less scalable 'preshared key' (PSK) mode, where every allowed computer is given the same passphrase. In PSK mode, security depends on the strength and secrecy of the passphrase. The design of WPA is based on a Draft 3 of the IEEE 802.11i standard (Wikipedia)

WPA-Radius

WPA-Radius is an acronym for <u>W</u>i-Fi <u>P</u>rotected <u>A</u>ccess - Radius (802.1X authentication server). WPA was designed to enhance the security of wireless networks. There are two flavors of WPA: enterprise and personal. Enterprise is meant for use with an IEEE 802.1X authentication server, which distributes different keys to each user. Personal WPA utilizes less scalable 'pre-shared key' (PSK) mode, where every allowed computer is given the same passphrase. In PSK mode, security depends on the strength and secrecy of the passphrase. The design of WPA is based on a Draft 3 of the IEEE 802.11i standard (Wikipedia)

WPS

WPS is an acronym for <u>W</u>i-Fi <u>P</u>rotected <u>S</u>etup. It is a standard for easy and secure establishment of a wireless home network. The goal of the WPS protocol is to simplify the process of connecting any home device to the wireless network (Wikipedia).

WRED

WRED is an acronym for <u>Weighted Random Early Detection</u>. It is an active queue management mechanism that provides preferential treatment of higher priority frames when traffic builds up within a queue. A frame's DP level is used as input to WRED. A higher DP level assigned to a frame results in a higher probability that the frame is dropped during times of congestion.

WTR

WTR is an acronym for <u>W</u>ait <u>T</u>o <u>R</u>estore. This is the time a fail on a resource has to be 'not active' before restoration back to this (previously failing) resource is done.
